## Preface

Measuring economic progress is an important and valuable task for a Statistical Office as it serves as an extension to a regular industrial statistics programme. The Compendium of Industrial Statistics is designed to inform public discussion of the overall picture of economic activity within and across industries comprising the South African manufacturing sector. Information included in this document is for the reference period 2003-2007.

The Compendium is not a scorecard for government policy. It is an experimental publication, which in keeping pace with meeting user needs, will develop and evolve over time.

PJ Lehohla
Statistician-General

| gains from trade | real net exports (BLS, 1997: 155) |
| gross | total |

## Reporting practices

According to UNIDO (2005: 7, 9) the reporting convention on industrial statistics gives countries a choice between Revision 2 or Revision 3 of the International Standard Industrial Classification of All Economic Activities (ISIC). The reporting format in this edition of the Compendium follows Revision 2 applied to the three-digit manufacturing level.

Classifications employed in the Compendium and the resultant grouping of information this creates are intended for statistical convenience and do not express a judgment about the state reached by a particular industry in its degree of development or regarding its economic system. Furthermore any mention of firm names or commercial products does not imply endorsement by Statistics South Africa.

The data in the Compendium derives from samples, which by specification are not designed at the three-digit level, i.e. branch level, of the manufacturing sector. It is drawn from various annual sources within Statistics South Africa including the annual financial survey, labour force survey, as well as unpublished records of price statistics and national accounts for the period 2003-2007.

Periods set off by a hyphen such as 2003-2007, include the beginning and end time of the period.

Information is either expressed in amount totals, counts, ratios or percentages as indicated. Totals may not add precisely because of rounding. Growth rates are expressed in percentages. Index numbers are expressed in basis points or as fractions, whichever is indicated. Ratios are expressed as fractions. The currency of financial values is the Rand.

Numbers representing totals of counts, indices, percentages, ratios, and these per head are given as an unweighted average. The rest of the aggregates are given as sum totals.

Both the direction and rate of change in the reported indicators are important in terms of making inferences about existing and prospective patterns. Just as rates differ, so do levels. The Compendium makes possible the assessment of both.

For space reasons, a balance has to be made with regard to the number of indicators the Compendium contains. If too many indicators were shown, assimilation of the reported information would be compromised. If too few are shown, important information may be omitted and the overall picture of economic activity within and across industries might be biased. It is considered that the reported number of indicators addresses the situation appropriately.

Regarding usage, we encourage feedback about this publication to ensure that it meets user needs. In this regard, we welcome your suggestions and comments. Please refer to the questionnaire and contact details provided at the end of this publication.

## 1. Introduction

The Compendium of Industrial Statistics is a publication about the economic progress of the industries comprising the South African manufacturing sector. It gives an insight into the national trends characterising this progress.

The choice of economic progress as the primary concept for the publication is not accidental.

Economic progress may be regarded as the process of industry development reflecting the transmission of knowledge and its resultant advances thereof (Lachmann, 1978: 28).

Measuring economic progress as an extension to a regular industrial statistics programme is an important and valuable task that a national statistical agency can take on.

There is an ongoing public interest in the various aspects of economic life that define the existence of industries in terms of productivity, nurtured by innovation from industrial activity as well as by the skills and proficiency of the workforce engaged in these activities. The Compendium of Industrial Statistics provides a rich and digestible selection of objective statistical evidence for the factual assessment of these - by those who formulate and evaluate policy, researchers, and society at large.

The ultimate aim is to deliver an informative snapshot of this progress when making sense of the production, human resources, and competitive conditions in which industries reside. This should facilitate an informed determination about whether these conditions are getting better, and at what rate.

Economic progress is an intricate process and in this regard the Compendium contains a comprehensive array of indicators to aid its study. As part of this the Compendium organises data by three distinct but interrelated classifications, which give meaning to the reported numbers, thereby giving some guideposts by which to monitor this progress.

The classifications gauge knowledge, and particularly its transmission, as the basis for the organisation and conduct of economic activities within and across industries. The technical annex outlines the specifics of each classification. However for the present moment, some brief but detailed non-technical remarks are offered to help clarify their usage.

The first of these classifications, the R\&D or innovation-based classification scheme, decomposes industries into R\&D intensive and non-R\&D intensive industries depending on their technological status. This classification has its origin in the nature of industrial/ production processes, which are implicitly considered in the construction of the International Standard Industrial Classification System of All Economic Activities (ISIC). Here industries are defined in terms of establishments, i.e. firms, primarily engaged in producing a product or group of products that are related by the technical process used in production. It is possible to hypothetically distinguish between whether such a production process or processes tend to remain unchanged, eventually becoming outdated without necessarily inhibiting industries from their existence, or if they are subject to constant change if the industry is to exist at all. Industries in the former category can be classified as non-R\&D intensive, whereas industries in the latter category may be designated as R\&D intensive.

It is also important to recognise that the evolution of technical processes brings complexity and sophistication to economic activities, which has the effect of transforming the skill requirements of the workforce. Productivity, which denotes output per worker, depends on the amount of capital available per worker. Accordingly exercising control over these technical processes which are inextricably connected with capital accumulation is a matter of knowledge, and specifically of the capability (i.e. skill, and proficiency), and understanding the workforce has in order to master them effectively. In line with this the other two classifications focus on the evolving structure of employment. The first decomposes employment by skill type, and the second decomposes employment by the information or knowledge it may be regarded to possess in directing the production of goods.

Each of the above classifications is relative in character. They enable one to tell if a given industry or industry group is relatively more innovative compared to another, and in the same vein, if a given industry or industry group holds higher skilled, more knowledgeable employees vis-à-vis another.

In a nutshell, the Compendium of Industrial Statistics should serve as an indispensable companion to exploring the economic progress of South Africa's manufacturing industries. It is particularly useful in industry analysis where the objective is to determine how an industry fares in terms of its growth or lack thereof in relation to indicators that may be deemed important in assessing its current status or future potential. The compound annual growth rate is the metric usually deployed for this purpose. The resultant calculations can flag out positive and negative areas associated with the economic situation of the industry.

The section outline of the remainder of the Compendium is as follows:

The key findings section gives two examples of the type of industry analysis the Compendium makes possible using the compound annual growth rates for a selection of indicators it contains. The examples look at the two leading industries by output emerging out of their respective R\&D and non-R\&D intensive segments over the period of coverage. This is the transport equipment industry from the R\&D segment and the food products industry from the non-R\&D segment. Their illustrative reports suggest possible interpretations of the data irrespective of which industry may otherwise be considered.

The summary tables section captures cross-sectional industry details by type of ownership, production, employment, knowledge and skills, productivity, pricing and operational performance.
The technical annex section deals with the conceptual methods followed in the assembly of the Compendium.

## 2. Key findings

### 2.1 Transport equipment industry

The transport equipment industry contributes on average $14,76 \%$ to total manufacturing output and is responsible for $6,92 \%$ of total manufacturing employment. The industry comprises the following activities:

- manufacture of motor vehicles;
- manufacture of bodies (coachwork) for motor vehicles;
- manufacture of trailers and semi-trailers;
- manufacture of parts and accessories for motor vehicles and their engines;
- building and repairing of ships and boats;
- manufacture of railway and tramway locomotives and rolling stock;
- manufacture of aircraft and space craft;
- and manufacture of transport equipment not elsewhere classified.

Table A depicts the growth situation of the industry. With regard to production adjusted for inflation, i.e., index of real production; between 2003 and 2007, the industry realised a steady growth rate of $4,92 \%$ per annum. During the same period, value added in real terms grew by $4,91 \%$ per annum.

The industry is a considerable employer of highly skilled labour. Between 2003 and 2007, employment grew at a compound annual rate of $9,47 \%$. During the same period, the percentage of highly skilled personnel grew faster at $5,11 \%$ per annum compared to low skilled personnel whose growth rate was $2,94 \%$.

Notwithstanding the rise in employment, which is coupled to a pursuant increase in compensation, labour productivity in the industry is on a decline, registering an ongoing contraction at an annual rate of 4,16\% between 2003 and 2007. By transmission, the industry's capital-labour ratio, capital productivity, and total factor productivity, showed a decline during the same period.

As part of increasing employment opportunities, the recruitment of more labour is attracting higher compensation for services rendered. Remuneration increased, matching the overall growth rate in employment. It appears capital deepening may be
responsible for this outcome, which speaks positively for the future outlook of the industry.

Table A: Transport equipment industry: Growth rates of selected economic indicators: 2003-2007 (percentage)

| Indicator | Rate |
| :--- | :--- |
| Real net exports (Rands) | $\uparrow$ 10,13 |
| Index of real remuneration (2003=100) | $\uparrow 9,68$ |
| Employment in numbers (count) | $\uparrow 9,47$ |
| Undistributed profit in current prices (R million) | $\uparrow 8,05$ |
| Number of firms (count) | $\uparrow 6,88$ |
| Index of real capital stock (2003=100) | $\uparrow 5,58$ |
| High-skilled employees in total employment (percentage) | $\uparrow 5,11$ |
| Index of real production (2003=100) | $\uparrow 4,92$ |
| Index of real value added (2003=100) | $\uparrow 4,91$ |
| Low-skilled employees in total employment (percentage) | $\uparrow 2,94$ |
| Fisher price index (2003=100) | $\uparrow 1,81$ |
| Rate of return (percentage) | $\uparrow$ 0,05 |
| Total factor productivity index (2003=100) | $\downarrow-0,03$ |
| Price-marginal cost margin (ratio) | $\downarrow-0,26$ |
| Capital productivity index (2003=100) | $\downarrow-0,63$ |
| Interest cover (ratio) | $\downarrow-1,01$ |
| Low-moderately skilled employees in total employment (percentage) | $\downarrow-2,74$ |
| Elasticity of demand (ratio) | $\downarrow-2,95$ |
| Capital-labour ratio index (2003=100) | $\downarrow-3,55$ |
| Labour productivity index (2003=100) | $\downarrow-4,16$ |
| Rosenbluth index (ratio) | $\downarrow-4,75$ |
| Moderately-highly skilled employees in total employment (percentage) | $\downarrow-6,44$ |

Inflation-adjusted capital stock increased at a steady annual rate of 5,58\% between 2003 and 2007. During the same period undistributed profit increased at a rate of $8,05 \%$ per annum. The accumulation of capital in conjunction with improved profittaking leads to an upward movement in the rates of return from investment. It may also be expected to facilitate an enhancement of labour productivity as the resultant creation and application of knowledge begin to pick up after capital deepening has settled.

As expected, improved profit taking is stimulating greater firm entry in the industry. This grew at a steady annual rate of $6,88 \%$ between 2003 and 2007. This may partially contribute to an increased rivalry in the industry. This is reflected in the Rosenbluth index of concentration, falling at an annual rate of $4,75 \%$ in the same period.

The industry's competitiveness suggests that its producers are able to maintain such a mix of economies of scale, product differentiation and absolute cost advantages as to enable it to generate a positive growth in real net exports at an annual rate of $10,13 \%$; as was the case between 2003 and 2007. These gains from trade indicate that in real terms, the prices producers get for their exports outperform the prices of imports they encounter.

The important role of imports is also evident. The price pressures they induce filter through in domestic production. In response, the industry experiences a steadily declining price-marginal cost ratio at an annual rate of $0,26 \%$ in the period 2003 to 2007. This also appears to be a contributing factor to taming inflationary increases to 1,81\% per annum.

### 2.2 Food products industry

The food products industry contributes $13,24 \%$ to total manufacturing output and is responsible for $11,33 \%$ of total manufacturing employment. The industry entails these activities:

- manufacture, processing and preservation of meat, fish, fruit, vegetables, oils and fats;
- manufacture of dairy products;
- manufacture of grain mill products, starches, starch products and prepared animal feeds;
- and the manufacture of other food products.

Table B shows the growth situation of the industry.

With regard to production adjusted for inflation, i.e., index of real production, the industry realised a steady annual growth rate of 4,54\% between 2003 and 2007. Consequently, during the same period, value added grew in real terms at a steady rate of $4,54 \%$ per annum.

The industry is a considerable employer of moderate to highly skilled labour with annual growth in this workforce category reaching 17,59\% per annum between 2003 and 2007. This is in spite of a steady decline in total industry employment accompanied by a notable downward fall in employment of low-skilled labour where the compound annual growth rate of job shedding reached $3,13 \%$ during the same period. This re-adjustment in skill may lead to an improvement in labour productivity, which appears to be confirmed by a lift-up in the rate of return from investment decisions. Between 2003 and 2007, this rate increased by $0,40 \%$ annually.

By transmission, the industry's capital-labour ratio, and total factor productivity also showed a steady rise of $9,03 \%$ per annum and $0,02 \%$ per annum - respectively over this period. On the other hand, capital productivity declined at an annual compound rate of $0,43 \%$. This suggests that although newly-recruited staff may be skilled, they may to some extent, be learning the operational proficiency needed to work with capital more effectively, especially at times of capital deepening when new methods of production have to be mastered. The industry seems to be undergoing such a transition without negative consequences to profit taking. For instance,
inflation-adjusted capital stock increased at an annual compound growth rate of $5,00 \%$ from 2003 to 2007. During the same period, undistributed profit rose at an annual compound growth rate of $10,93 \%$.

Table B: Food products industry: Growth rates of selected economic indicators: 2003-2007 (percentage)

| Indicator | Rate |
| :--- | :--- |
| Moderately-highly skilled employees in total employment (percentage) | $\uparrow 17,59$ |
| Elasticity of demand (ratio) | $\uparrow 14,95$ |
| Undistributed profit in current prices (R million) | $\uparrow 10,93$ |
| Capital-labour ratio index (2003=100) | $\uparrow 9,03$ |
| Labour productivity index (2003=100) | $\uparrow 8,56$ |
| Index of real capital stock (2003=100) | $\uparrow 5,00$ |
| Number of firms (count) | $\uparrow 4,79$ |
| Index of real value added (2003=100) | $\uparrow 4,54$ |
| Index of real production (2003=100) | $\uparrow 4,54$ |
| Fisher price index (2003=100) | $\uparrow 4,22$ |
| Low-moderately skilled employees in total employment (percentage) | $\uparrow 2,77$ |
| Index of real remuneration (2003=100) | $\uparrow 0,88$ |
| Rate of return (percentage) | $\uparrow 0,40$ |
| Total factor productivity index (2003=100) | $\uparrow 0,02$ |
| Capital productivity index (2003=100) | $\downarrow-0,43$ |
| Interest cover (ratio) | $\downarrow-1,09$ |
| Low-skilled employees in total employment (percentage) | $\downarrow-3,13$ |
| Real net exports (Rands) | $\downarrow-3,47$ |
| Employment in numbers (count) | $\uparrow-3,70$ |
| Rosenbluth index (ratio) | $\downarrow-5,49$ |
| High-skilled employees in total employment (percentage) | $\downarrow-6,54$ |
| Price-marginal cost margin (ratio) | $\downarrow-13,90$ |

Improved profit taking stimulates greater firm entry into the industry, which has grown on an annual compound basis at the rate of 4,79\%. In response to heightened rivalry, the Rosenbluth index of concentration decreased at a rate of $5,49 \%$ annually. An additional factor which may be assisting this decrease is competition from abroad, i.e., foreign trade.

The industry's negative position in real net exports has been steadily lessening at an annual rate of $3,47 \%$ between 2003 and 2007. This implies that in real terms the prices that enterprises get for exports although being sub-par to these for imports are gradually improving. This suggests that the industry's mix of economies of scale, product differentiation and absolute cost advantages is beginning to align to the offerings of foreign competitors. Signs of this emerge from the industry's pricemarginal cost ratio declining at an annual compound growth rate of $13,90 \%$ over the 2003-2007 period. However the inflationary increases depicted by the Fisher price index, which in the same period rose at a compound growth rate of 4,22\% per annum seem to indicate that this process is in its infancy.

## 3. Summary tables

The summary tables show the Compendium indicators on an industry-by-industry basis. The data is sorted by the R\&D classification or segment to which each industry belongs. Within each segment, industries are arranged in an increasing order of their respective ISIC code.

Each section heading identifies the indicator reported on, followed by an outline of its contents: -

### 3.1 Ownership breakdown

Table 1: Proportion of private sector firms in total firms: 2003-2007 (percentage)
Table 2: Proportion of public sector firms in total firms: 2003-2007 (percentage)
Table 3: Proportion of other firms in total firms: 2003-2007 (percentage)

### 3.2 Production

Table 4: Production in current prices: 2003-2007 (R million)
Table 5: Value added in current prices: 2003-2007 (R million)
Table 6: Capital stock in current prices: 2003-2007 (R million)
Table 7: Index of real production: 2003-2007 (2003=100)
Table 8: Index of real value added: 2003-2007 (2003=100)
Table 9: Index of real capital stock: 2003-2007 (2003=100)

### 3.3 Employment

## 4. Technical annex

### 4.1 Concordance tables

The concordance table for manufacturing between ISIC Revision 2 (UNIDO, 2005: 18-20; UN, 2004: 199-221) and the South African Standard Industrial Classification for All Economic Activities (SA SIC, $5^{\text {th }}$ Edition, Statistics South Africa, 1993: 13-25) is presented in table C. In addition a detailed description is provided in table D. The replication achieved is identical to the classification of industry proposed under ISIC. However, due to conversion, industries re-group into 26 branches in relation to 28 under ISIC.

One set of affected industries is petroleum refineries (353), and miscellaneous products of petroleum and coal (354), which are now merged into one - manufacture of petroleum and related products. The other is pottery, china and earthenware (361), and structural clay products, cement, lime, plaster, and other associated products (369), which are also merged into one - manufacture of non-metallic mineral products.

The merging of the above industries is also adopted by other countries (UNIDO, 2005: 232, 492, 538) due to the closeness in production processes between them. However an exact conversion is not possible in all instances owing to a country's specific conditions, where industries are originally grouped according to what most closely resembles the structure of production in that country.

Table C: Concordance between SA SIC and ISIC: Manufacturing sector

| Industry | SA SIC Code | ISIC Code |
| :---: | :---: | :---: |
| Food products | 301/2/3/4 | 311/2 |
| Beverages | 305 | 313 |
| Tobacco | 306 | 314 |
| Textiles | 311/2/3 | 321 |
| Wearing apparel, except footwear | 314 | 322 |
| Leather and fur products | 315/6 | 323 |
| Footwear, except rubber or plastic | 317 | 324 |
| Wood products, except furniture | 321/2 | 331 |
| Furniture and fixtures, excluding metal | 391 | 332 |
| Paper and products | 323 | 341 |
| Printing and publishing | 324/5 | 342 |
| Industrial chemicals | 333/4/6 | 351 |
| Other chemicals | 335 | 352 |
| Petroleum and related products | 331/2 | 353/4 |
| Rubber products | 337 | 355 |
| Plastic products | 338 | 356 |
| Non-metallic mineral products | 342 | 361/9 |
| Glass and products | 341 | 362 |
| Iron and steel | 351/3 | 371 |
| Non-ferrous metals | 352 | 372 |
| Fabricated metal products | 354/5 | 381 |
| Non-electrical machinery | 356/7/9 | 382 |
| Electrical machinery | 326/358/361/2/3/4/5/6/371/2/3 | 383 |
| Transport equipment | 381/2/3/4/5/6/7 | 384 |
| Professional and scientific equipment | 374/5/6 | 385 |
| Other manufacturing industries | 392/5 | 390 |

Table D: Description of concordance between SA SIC and ISIC: Manufacturing sector

| ISIC | SIC | Division/Branch |
| :---: | :---: | :---: |
| 311/2 | n.e.s. | Food manufacturing |
|  | 301 | Produce, process and preserve meat, fish, fruit, vegetables, oils and fats |
|  | 302 | Manufacture dairy products |
|  | 303 | Manufacture grain and mill products, starches and starch products and prepared animal feeds |
|  | 304 | Manufacture other food products |
| 313 | 305 | Beverage industries |
| 314 | 306 | Tobacco manufactures |
| 321 | n.e.s. | Manufacturing of textiles |
|  | 311 | Spin, weave and finish textiles |
|  | 312 | Manufacture other textiles |
|  | 313 | Manufacture knitted and crocheted fabrics and articles |
| 322 | 314 | Manufacturing of wearing apparel, except footwear |
| 323 | n.e.s. | Manufacture leather and products of leather, leather substitutes and fur, except footwear and fur apparel |
|  | 315 | Dress and dye fur; manufacture articles of fur |
|  | 316 | Tan and dress leather; manufacture luggage, handbags, saddlers and harnesses |
| 324 | 317 | Manufacturing of footwear |
| 331 | n.e.s | Manufacturing of wood and wood and cork products, except furniture |
|  | 321 | Saw milling and planing of wood |
|  | 322 | Manufacture products of wood, cork, straw and plaiting materials |
| 332 | 391 | Manufacturing of furniture |
| 341 | 323 | Manufacturing of paper and paper products |
| 342 | n.e.s. | Printing, publishing and allied industries |
|  | 324 | Publish |
|  | 325 | Printing and service activities related to printing |
| 351 | n.e.s. | Manufacturing of industrial chemicals |
|  | 333 | Process nuclear fuel |
|  | 334 | Manufacture basic chemicals |
|  | 336 | Manufacture man-made fibres |

Table D: Description of concordance between SA SIC and ISIC: Manufacturing sector (continued)

| 352 | 335 | Manufacturing of other chemical products |
| :---: | :---: | :---: |
| 353/4 | n.e.s. | Petroleum and related products |
|  | 331 | Manufacturing of miscellaneous products of petroleum and coal including manufacture of coke oven products |
|  | 332 | Petroleum refineries/synthesizers |
| 355 | 337 | Manufacturing of rubber products |
| 356 | 338 | Manufacture plastic products |
| 361/9 | 342 | Manufacturing of non-metallic mineral products n.e.c. |
| 362 | 341 | Manufacturing of glass and glass products |
| 371 | n.e.s. | Iron and steel basic industries |
|  | 351 | Manufacturing of basic iron and steel |
|  | 353 | Cast metals |
| 372 | 352 | Manufacturing of basic precious and non-ferrous metals |
| 381 | n.e.s. | Manufacturing of fabricated metal products, except machinery and equipment |
|  | 354 | Manufacture structural metal products, tanks, reservoirs and steam generators |
|  | 355 | Manufacture other fabricated metal products; metalwork service activities |
| 382 | n.e.s. | Manufacturing of machinery except electrical |
|  | 356 | Manufacture general purpose machinery |
|  | 357 | Manufacture special purpose machinery |
|  | 359 | Manufacture office, accounting and computing machinery |
| 383 | n.e.s. | Manufacturing of electrical machinery, apparatus, appliances and supplies |
|  | 326 | Reproduce recorded media |
|  | 358 | Manufacture household appliances |
|  | 361 | Manufacture electric motors, generators and transformers. |
|  | 362 | Manufacture electricity distribution and control apparatus |
|  | 363 | Manufacture insulated wires and cables |
|  | 364 | Manufacture accumulators, primary cells and primary batteries |
|  | 365 | Manufacture electric lamps and lighting equipment |
|  | 366 | Manufacture other electrical equipment n.e.c. |

Table D: Description of concordance between SA SIC and ISIC: Manufacturing sector (concluded)

|  | 371 | Manufacture electronic valves and tubes and other electric components |
| :---: | :---: | :---: |
|  | 372 | Manufacture television and radio transmitters and apparatus for line telephony and line telegraphy |
|  | 373 | Manufacture television and radio receivers, sound or video recording or reproducing apparatus and associated goods. |
| 384 | n.e.s. | Manufacturing of transport equipment |
|  | 381 | Manufacture motor vehicles |
|  | 382 | Manufacture bodies (coachwork) for motor vehicles; manufacture of trailers and semi-trailers |
|  | 383 | Manufacture parts and accessories for motor vehicles and their engines |
|  | 384 | Build and repair ships and boats |
|  | 385 | Manufacture railway and tramway locomotives and rolling stock |
|  | 386 | Manufacture aircraft and space craft |
|  | 387 | Manufacture transport equipment n.e.c. |
| 385 | n.e.s. | Manufacturing of professional and scientific, and measuring and controlling equipment n.e.c., and of photographic and optical goods |
|  | 374 | Manufacture medical appliances and instruments and appliances for measuring, checking, testing, navigating and other purposes, except optical instruments |
|  | 375 | Manufacture optical instruments and photographic equipment |
|  | 376 | Manufacture watches and clocks |
| 390 | n.e.s. | Other manufacturing industries |
|  | 392 | Manufacture n.e.c. |
|  | 395 | Recycle n.e.c |

### 4.2 Classifications

To organize information meaningfully and systematically into a standard format that is useful for determining any similarity or lack thereof across industries, classifications are extensively used throughout the Compendium to attain structured groupings on a number of characteristics by which an industry can be described in general. These include type of ownership, technological status, R\&D intensiveness, and composition of human capital.

The type of ownership as to whether control over firms in an industry is in private or government hands is determined by the approach suggested in sections 4 and 5 of the System of National Accounts, 1993 (UN, 1993: 87-119). Here the different forms of business ownership by which a firm is legally established are identified according to their institutional belonging. Table E depicts this institutional breakdown.

The identification of industries by technological status is adapted from UNIDO (2002: 146) and OECD (2005: 172), and this for their R\&D intensiveness, which distinguishes between R\&D-intensive and non-R\&D-intensive industries, is adopted from Scott (1984: 82-83). The resultant scheme is displayed in table F. Table G shows industries by technological status and R\&D intensity after application of this scheme at an industry-by-industry level.

The R\&D or innovation-based classification decomposes industries into R\&D intensive and non-R\&D intensive depending on their technological status. This classification has its origin in the nature of industrial processes which are implicitly considered in the construction of the International Standard Industrial Classification System of All Economic Activities (ISIC). Here industries are defined in terms of establishments, i.e., firms, primarily engaged in producing a product or group of products that are related by the technical process used in production. Thus we can hypothetically distinguish between whether such production process or processes tend to remain unchanged, eventually becoming outdated without necessarily inhibiting industries from their existence, or if they are subject to constant change if the industry is to exist at all. The former category to which some industries belong is referred to as Non-R\&D intensive, and the latter to which other industries belong is named R\&D intensive.

Table E: Breakdown and composition of ownership by institutional sector

| Institutional sector | Forms of ownership |
| :--- | :--- |
| Private sector | Individual enterprises, partnerships, <br> public/listed companies, private/unlisted <br> companies, close corporations, cooperative <br> societies. |
| Public sector | Government enterprises, public corporations. |
| Other | Non-profit institutions like public-private <br> partnerships, community based initiatives, etc. |

Table F: Degree of industry innovation by technological status of industries

| Industries by R\&D intensity | Technological status |
| :--- | :--- |
| R\&D-intensive | Medium-high tech, high-tech industries. |
|  |  |
| Non-R\&D-intensive | Low tech, low-medium tech industries. |

Table G: Technological status and R\&D intensity: Manufacturing industries

| Industry | ISIC <br> Code | Technological <br> Status | R\&D <br> Intensity |
| :--- | ---: | :--- | :--- |
| Food products | $311 / 2$ | Low tech | Non-R\&D intensive |
| Beverages | 313 | Low tech | Non-R\&D intensive |
| Tobacco | 321 | Low tech | Non-R\&D intensive |
| Textiles | 322 | Low-medium tech | Non-R\&D intensive |
| Wearing apparel, except <br> footwear | 323 | Low-medium tech | Non-R\&D intensive |
| Leather and fur products | 324 | Low-medium tech | Non-R\&D intensive |
| Footwear, except rubber or <br> plastic | 331 | Low tech | Non-R\&D intensive |
| Wood products, except furniture | 332 | Low-medium tech | Non-R\&D intensive |
| Furniture and fixtures, <br> excluding metal | 342 | Low tech | Non-R\&D intensive |
| Paper and products | 351 | Medium-high tech | R\&D-intensive |
| Printing and publishing | 352 | High tech | R\&D-intensive |
| Industrial chemicals | $353 / 4$ | Medium-high tech | R\&D-intensive |
| Other chemicals | 355 | Low tech | Non-R\&D intensive |
| Petroleum and related products | 356 | Medium-high tech | R\&D-intensive |
| Rubber products | $361 / 9$ | Low-medium tech | Non-R\&D intensive |
| Plastic products | 362 | Low tech | Non-R\&D intensive |
| Non-metallic mineral products | 371 | Medium-high tech | R\&D-intensive |
| Glass and products | 372 | Medium-high tech | R\&D-intensive |
| Iron and steel | 381 | Low-medium tech | Non-R\&D intensive |
| Non-ferrous metals | 382 | Medium-high tech | R\&D-intensive |
| Fabricated metal products | High tech | R\&D-intensive |  |
| Non-electrical machinery | 384 | High tech | R\&D-intensive |
| Electrical machinery | High tech | R\&D-intensive |  |
| Transport equipment | Low-medium tech | Non-R\&D intensive |  |
| Professional and <br> scientific equipment | R\&D-intensive |  |  |
| Other manufacturing industries | 390 |  |  |
|  |  | 385 |  |

Considering that innovation and knowledge go hand in hand, by extension the next two classifications are applied to the workforce of each industry to look at the composition of employment in terms of the human capital it embodies. Human capital encapsulates all the knowledge and expertise that a workforce accumulates over time to enable it to increase the productivity of an industry (Doyle, 2005: 24, 296, 348).

The classification of employment by type of skill, which is shown in table H , is adapted from Hoffmann (1999: 6-9) and derives from occupations held.

The different levels of skill highlight the differences in understanding that the implementation of tasks in different jobs requires. The resultant skill levels demonstrate differences in the range and complexity of the tasks involved in a job. They reflect the type of knowledge applied, tools and equipment used, materials worked with, and the nature of the goods and services produced.

The classification of employment by its knowledge makeup, which is shown in table I, is adopted from HRSDC (1997: 1-3) and Masse, Roy, and Gingras (1999: 9-12). It also derives from occupations held, and treats knowledge as a basis for the organisation and conduct of economic activities. This classification makes it possible to understand how transformed the skill requirements of an industry's workforce are, in light of the type of technologies used in production processes in terms of the complexity and technical sophistication they bring to economic activities.

According to the knowledge-based classification the workforce is divided into two main categories, namely, information and non-information workers. Information workers are further divided into two groups: data and knowledge workers. Data occupations involve the manipulation of symbolic information while knowledge occupations involve the development of ideas or of expert opinions. In other words, data workers in most clerical occupations, use, transmit, or manipulate knowledge while knowledge workers such as engineers and scientists produce it. The noninformation category is composed of goods workers and services workers. Workers in the former category such as machine operators and assemblers transform materials, whereas workers in the latter group such as security guards and babysitters perform personal services. In either event the more routine or compartmentalised nature of the tasks entailed in these occupations implies that they carry no improvement or creation of knowledge.

Table H: Employment by skill type determined from occupations

| Skill type | Occupations |
| :--- | :--- |
| High-skilled | Legislators, senior officials and managers, <br> professionals. |
| Moderately-highly skilled | Technicians and associate professionals, <br> skilled agricultural and fishery workers. |
| Low-moderately skilled | Clerks, service workers and shop and market <br> sales workers, plant and machine operators <br> and assemblers. |
| Low-skilled | Elementary occupations, craft and related <br> workers. |
| Other | Occupation not elsewhere defined, occupation <br> not adequately defined, unspecified, not <br> applicable. |

Table I: Employment by knowledge type determined from occupations

| Knowledge type | Occupations |
| :--- | :--- |
| Knowledge employees | Legislators, senior officials and managers, <br> professionals. |
| Data employees | Technicians and associate professionals, <br> clerks. |
| Goods employees | Plant and machine operators and assemblers, <br> skilled agricultural and fishery workers. |
| Services employees | Service workers and shop and market sales <br> workers, craft and related workers, elementary <br> occupations. |
| Information type employees | Knowledge, data occupations. |
| Other | Occupation not elsewhere defined, occupation <br> not adequately defined, unspecified, not <br> applicable. |

### 4.3 Selected Indicators

The choice of Compendium indicators for the study of the performance of industry is motivated by a number of proposals outlined in several key references (Eurostat, 2003: 182-190; Hoffmann, 1999: 6-9; HRSDC, 1997: 1-3; Masse, Roy, and Gingras, 1999: 9-12; OECD, 2001: 13-18; OECD, 2002: 3; OECD, 2005: 181-183; OECD, 2007: 16; UN, 2003: 14-15; UNIDO, 2005: 8-11).

The resultant indicators on which information is presented are captured in table J and their interpretation is provided next to them.

Table J: Economic indicators and their interpretation

| Category | Indicator | Interpretation |
| :---: | :---: | :---: |
| General economic level and performance |  |  |
|  | Ownership | Right of control over an enterprise. |
|  | Production | Amount of output produced. |
|  | Value added | Amount of improvement to products after passage through the production process. |
|  | Capital stock | Amount of physical capital held. |
|  | Index of real production | Growth in output. |
|  | Index of real value added | Growth in output improvement. |
|  | Index of real capital stock | Growth in physical capital held. |
| Employment |  |  |
|  | Number of employed | Job creation. |
|  | Remuneration | Compensation of employees. |

Table J: Economic indicators and their interpretation (continued)

|  | Personnel costs | Compensation per employee. |
| :---: | :---: | :---: |
|  | Index of real remuneration | Growth in labour costs. |
|  | Employment by skills type | Capability of workforce. |
|  | Employment by knowledge type | Expertise of workforce. |
| Productivity |  |  |
|  | Labour productivity | Effectiveness of labour to generate value added. |
|  | Capital productivity | Effectiveness of capital usage to generate value added. |
|  | Total factor productivity | Effectiveness of all factors of production to generate value added. |
|  | Capital-labour ratio | Capital intensity. |
| Pricing behaviour |  |  |
|  | Fisher price index | General level of prices that captures substitution effect. |

Table J: Economic indicators and their interpretation (concluded)

|  | Price-marginal cost margin | Mark-up of general price level over marginal cost level of operations. |
| :---: | :---: | :---: |
|  | Real net exports | Real gains from international trade. |
|  | Rosenbluth index | Extent to which any firm can expect to have significant industry presence. |
|  | Number of firms | Industry structure. |
|  | Elasticity of demand | Responsiveness of producer prices to changes in demand conditions. |
| Operational performance |  |  |
|  | Operating profit | Realised earnings from principal/main trading activity. |
|  | Undistributed profit | Profit retained for reinvestment in operations or for purpose of meeting future capital needs. |
|  | Rate of return | Ability to generate profit for reinvestment in operations from invested capital. |
|  | Interest cover | Earnings/income available to service debt. |

### 4.4 Derivation of indicators

Table K shows the calculation procedures in the estimation of the composite indicators of the Compendium, i.e., those involving more than a single construct. This is accompanied by a clarification of the additional steps taken with reference to those cases which may be less than clear-cut in their computations.

Regarding the procedure for calculating capital stock the OECD manual on measuring capital (2001b: 89) advises that:
"no strong conclusion has been reached on the matter and much speaks for solutions that are governed by data availability."

In terms of the calculation procedure, capital income is represented by gross operating surplus (OECD, 2001a: 69). As for the rate of return, there are a number of proposals made. One proposal is to take the rate of return as the interest rate for government bonds (OECD, 2001a: 70), and another is to use the average of the rate of interest earned and rate of interest paid (OECD, 2001b: 88). This average can be seen as an estimate of the "pure" rate of return, i.e. the compensation that lenders demand for postponing consumption to a future period.

Overall, there is no specific practice agreed upon in the selection of the rate of return metric due to the same reservations about what can be done best with available data.

In the Compendium, the rate of return applied to the calculation of capital stock is the average between the undistributed profit to capital expenditure at replacement value and the average of interest earned and interested paid expressed as a proportion of total income. The incorporation of replacement value provides an insight of the longterm range of investment decisions since this value depicts the long-run cost of providing for buying comparable quality assets used up in the production process.

Table K: Calculation procedures: Compendium indicators

| Indicator | Procedure | Sources |
| :--- | :--- | :--- |
| Production | sales + change in inventories | UN (1993: 131) |
| Value added | production - intermediate <br> consumption | UN (2000: 48) |$|$| Capital stock | capital income/rate of return |
| :--- | :--- | | OECD (2001a: 70); |
| :--- |
| OECD (2001b: 89) |

Table K: Calculation procedures: Compendium indicators (concluded)

| Elasticity of demand | \| (total revenue/total profit) * <br> herfindahl index\| <br> where total profit ~ operating profit | Tirole (1998: 223) |
| :---: | :---: | :---: |
| Real net exports | real total income - real value added | SADC (1999: 93) |
| Rosenbluth index | $1 /\left[n^{*}(1-G)\right]$ <br> where n is the number of firms, and $G$ is the Gini index | Leach (1997: 16) |
| Gini index | $\begin{aligned} & N \\ & 2 / \mu N^{2} *\left(\sum r_{i}{ }^{*} y_{i}\right)-[(N+1) / N] \\ & i=1 \end{aligned}$ <br> where $\mu$ is the mean value of the distribution, N the number of intervals, $y_{i}$ the $i^{\text {th }}$ interval value, and $r_{i}$ the rank of the $i^{\text {th }}$ value in an ascending order | Karagiannis and <br> Kovacevic (2000: 120) |
| Rate of return | (undistributed profit/capital expenditure at replacement value) $\text { * } 100$ | Adapted from proposals in OECD (2003: 12-14) |
| Interest cover | total income/interest paid where total income $=$ compensation of employees + gross operating surplus | Kolitz and Rabin (1993: 8) |

Interest paid is obtained as the difference between cost of capital and depreciation (Church and Ware, 2000: 427; World Bank, 1995: 103). If it is assumed that markets are in equilibrium, meaning that they clear in the sense that supply equals demand, and by extension that for each industry total inputs equal total outputs, Statistics Canada (2007) proposes that in turn, cost of capital can be calculated as output less labour and intermediate expenses. This approach is also adopted here to determine the cost of capital.

Once determined, interest paid also feeds as the denominator to the interest cover ratio.

Interest earned is the balance between the sum of net operating surplus and interest paid less pre-tax profit (Statistics New Zealand, 2006: 3). Net operating surplus on the other hand is gross operating surplus less depreciation (SARB, 2005: 182).

The taking of averages in the determination of employment levels produces extreme values in a number of instances, which distorts a clear reading of the pattern of employment. This also extends to the compensation per employee, i.e. personnel costs and as a consequence also feeds into total compensation, i.e. remuneration. Anscombe and Tukey (1963: 146, 149), and Wilcox (2005: 2121) suggest that such cases can be resolved by winsorisation which cleans out the data set from its unusually large or small values.

Winsorising the values means that a predetermined percentage of the smallest and largest values are replaced with the next in order smallest and largest values respectively. Wilcox (2005: 2121) suggests a predetermined percentage of $10 \%$. The figures on employment and compensation including compensation per employee that appear in this Compendium were obtained from the application of this technique using the suggested $10 \%$. For identical reasons, the same winsorisation technique was also applied to the 2007 figures of elasticity of demand. In turn the associated changes were also carried through to the numbers of the price-marginal cost margin.

The procedures for calculating the price-marginal cost margin and elasticity of demand are derived under the assumptions of homogeneity and proportionality. The homogeneity assumption holds that: (a) each industry produces a single output (i.e. all the products of the industry are either perfect substitutes for one another or are produced in fixed proportions; (b) each industry has a single input structure (i.e. one which does not vary in response to changes in product mix); and (c) there is no substitution between the products of different industries. The proportionality assumption holds that average costs do not vary with output. This means that the change in output of an industry will lead to proportional changes in the quantities of its intermediate and primary inputs (i.e., for any output, each of these inputs will be a fixed proportion of the total). These assumptions are realistic for the reference year for which they are calculated. In such an instance the time horizon to which they apply, for instance a year or less, is short enough for them not to be weakened/invalidated by changes in product mix (and consequent changes in inputs), introduction of new products and/or materials, substitution of imports for local
produce or vice versa, economies of scale, and technological change involving the substitution of factors (e.g., more capital, less labour).

The determination of the concentration indices is done according to grouped data using deciles of turnover, which is taken to be the measure of industry size. The starting point is the calculation of the Gini index (G). This is calculated according to the method described in Karagiannis and Kovacevic (2000: 120) shown in table K. Once the Gini index is obtained, it feeds directly into the calculation of the Rosenbluth index as shown.

Two options are available to calculate real net exports. Table 5 gives the method that is used here. The alternative approach which yields theoretically equivalent results is to take the difference between real exports and imports obtained from deflation of the current values of exports and imports by their export price and import price indices respectively (BLS, 1997: 155).

As an interpretation note to the elasticity figures, one may consult Reekie and Crook (1995: 179). In brief, an elasticity of demand less than 1 in absolute terms signals that demand is inelastic. Conversely elasticity greater than 1 in absolute terms signals that demand is elastic. When there are few substitutes, demand tends to be inelastic and vice versa. Necessities have relatively inelastic demand. Within limits, they may be bought at any price. On the other hand luxuries have more elastic demands, and consumption will be more price sensitive for them. Absolutely inexpensive products will have less elastic demand than more expensive ones. And derived demand will be less elastic than primary demand.

Finally, as observed earlier in the key findings section a handful of indicators are considered by their compound annual growth rate. This is calculated from the last (L) and first (F) value in a series by the following standard expression (ITU, 2007: 204):

$$
\left[(L / F)^{1 / n u m b e r ~ o f ~ y e a r s ~}-1\right] * 100
$$

### 4.5 Deflation

The derivation of many of the indicators in the Compendium involves volume indices.

Deflation gives the indicator in terms of volume and these figures can in turn be converted into a volume index, which is also referred to as an index of real values. The resulting indices are conceptually equivalent to indices that are developed using data based on physical quantities of products (BLS, 1997: 104).

Deflation entails the derivation of real values for a given indicator. It involves the division of an indicator's nominal value by a general price index, which in this instance is the Fisher price index.

The choice of an appropriate price index for manufacturing as the sector of coverage in the Compendium is of particular relevance given its innovative nature. By definition, it comprises firms that are engaged in the physical or chemical transformation of materials, substances, or components into new products (UN, 2004: 67). In acknowledgment of this, Eurostat (2006: 52-55) advocates the use of a Paasche-type, i.e. price deflator price index for industry inflation and deflation vis-àvis a Laspeyers-type, i.e. producer price index. The former operates under the assumption that the current structure of production is more or less similar to that of the previous periods, whereas the latter assumes that the structure of production in the base period will remain more or less constant as one moves forward in time (Eurostat, 2006: 53). It is further explained that:
> "In reality observation units appear and disappear, the output mix of observation unit's changes, some products/services disappear from the market, and new products/services are introduced. Especially in areas with frequent technological changes this will have the effect that a direct Laspeyres price index is unable to track current price changes adequately. In some cases, it is even impossible to construct such a price index because products/services existing in the base period are no longer produced in the comparison period."

Eurostat (2006: 65)

Conversely it appears the use of the Laspeyres price index will be appropriate for these industries where innovation does not operate at full throttle.

Aside from having to have comprehensive knowledge of the innovative activity prevailing in different industries so that we know which index to apply to which industry, there is no expectation for the indices to coincide in level or movement.

The Paasche index $(P)$ will exceed its Laspeyers counterpart if prices and quantities tend to move in the same direction with the passage of time (UN, 1993: 383-384). On the other hand the Laspeyers index ( L ) will exceed its Paasche counterpart if prices and quantities tend to move in opposite directions over time (UN, 1993: 383-384). To compensate for these divergences as well as to deal with the lack of comprehensive knowledge about innovative activity, and to enable one to know which index to apply where, the Fisher price index ( $F$ ) may be used. This index falls between the two, i.e., Laspeyers and Paasche price indices, and excludes price movements that tend to be volatile. It is the geometric mean of the Laspeyers and Paasche price indices:

$$
F=\left(L^{*} P\right)^{1 / 2}
$$

Taking cognisance of the above differences that may arise from either using a Laspeyres or a Paasche price index, deflation in the Compendium is thus done with the Fisher price index which adheres to recommended practice (BEA, 1992: 50-51; UN, 1993: 384). In view of that, this is also the index reported in the Compendium. In the calculation of the index, the Paasche index for each industry is proxied by its price deflator index, which is the percentage ratio of industry value added at current prices to industry value added at constant prices.

### 4.6 Glossary

This section explains the concepts and definitions considered in the preparation of the Compendium (Table L).

Terms are arranged alphabetically.

A single term can have more than one definition, as the concept it may refer to may have different meanings in different statistics.

## Table L: Description of concepts

$\left.$| Concept | Description |
| :--- | :--- |
| Account | A depository of information from supply and demand activities <br> resulting from economic decisions at a certain time. |
| Active <br> enterprise | A unit that is operational in the open market and that has paid value <br> added tax and/or income tax to the Revenue Service at least once. |
| Activity | A process involving a combination of actions that result in a certain <br> set of products and services. |
| Administered |  |
| price | The price of a product, which is set consciously by an individual <br> producer or group of producers and/or any price, which can be <br> determined or influenced by government, either directly, or through <br> one or other government agencies or institutions without reference to <br> market forces. |
| Advertising | Production of information by firms to help differentiate, and provide <br> information about products to consumers. |
| Asset | A resource controlled by an entity as a result of past events and from <br> which future economic benefits are expected to flow to the entity. |
| Balancing <br> item | The residual obtained by subtracting the total value of entries on one <br> side of an account from the total value of entries on the other side. |
| Break-up | An event where a legal unit is divided into two or more separate legal <br> units and the original legal unit ceases to exist. |
| Basic price | The amount receivable by the producer from the purchaser for a unit <br> of good or service produced, calculated as output minus any tax <br> payable plus any subsidy receivable on that unit as a consequence <br> of its production or sale. It excludes any transport charges, invoiced <br> separately by the producer. Basic price constitutes the preferred <br> method of output valuation. |
| charges |  |$\left|\begin{array}{l}\text { Intal payments for loaned funds. }\end{array}\right| \right\rvert\,$

## Table L: Description of concepts (continued)

| Capital expenditure | Any expenditure incurred or incidental to the acquisition or improvement of land, buildings, engineering structures and machinery and equipment. It confers a lasting benefit and results in the acquisition of, or extends the life of a fixed or long-term work, irrespective of whether payments are made to outside contractors or concerns, or the work is done by the enterprise itself. |
| :---: | :---: |
| Capital intensity | Th |
| Change in inventories | Change in inventories, including work-in-progress, consists of changes in: <br> (a) stocks of outputs that are still held by the units that produced them prior to them being further processed, sold, delivered to other units or used in other ways; and <br> (b) stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing. <br> Change in inventories is measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories. |
| Classification standard | Ordering of data by a prescribed or fixed rule. It ensures that information is classified consistently regardless of its collection, source, point of time, etc. |
| Compensation of employees | The total remuneration, in cash or kind, payable by an employer to an employee in return for work done by the latter during an accounting period. It is recorded on a gross basis, i.e. before any deduction of income taxes, retirement provisions, unemployment insurance and other social insurance schemes. It includes other forms of compensation, namely commissions, tips, bonuses, directors' fees and allowances such as those for holidays and sick leave, as well as military pay and allowances. It excludes employers' social contributions. |
| Compound annual growth rate | The average annual growth rate in an indicator or variable over a particular period of time. |

## Table L: Description of concepts (continued)

| Concentration | The extent to which a small number of firms in an industry account <br> for a large proportion of its total sales. An industry is said to be <br> concentrated if a few firms make most of its sales. |
| :--- | :--- | :--- |
| Concentration | A metric to identify the absence or presence of concentration in an <br> industry. Its values range between 0 and 1, which respectively <br> describe no concentration (0) or that a single firm makes all the <br> sales (1). The Gini index, Herfindahl index, and Rosenbluth index <br> are examples of concentration indices. |
| Consumer Price | A measure of the change over time in the general level of prices of <br> goods and services that a reference population acquires, uses or <br> pays for consuming. It is estimated as a series of summary <br> measures of the period-to-period proportional change in the prices <br> of a fixed set of consumer goods and services of constant quantity <br> and characteristics, acquired, used or paid for by the reference <br> population. Each summary measure is constructed as a weighted <br> average of a large number of aggregate indices. Each of the <br> aggregate indices is estimated using a sample of prices for a <br> defined set of goods and services obtained in, or by residents of, a <br> specific region from a given set of outlets or other sources of <br> consumption for goods and services. The CPI is a <br> Laspeyers/fixed-weight price index. |
| Cost of capital | The cost of use of a capital asset for a given period - that is, the <br> price for employing or obtaining capital services. The user cost of <br> capital is also referred to as the "rental price" of a capital good, or <br> the "capital service price". |
| Consumption of |  |
| fixed capital | An activity in which institutional units use up goods and services. It <br> can be either intermediate or final. <br> process during a given period resulting from physical deterioration, <br> normal obsolescence or normal accidental damage. |

Table L: Description of concepts (continued)

| Current price | The absolute price of a good or service prevailing at a particular period. |
| :---: | :---: |
| Deactivated enterprise | A statistical unit that is dormant, temporarily stopped trading, or is under sequestration. |
| Dividend | Distribution of profit to holders of equity in proportion to their holding. It is the portion of profits paid to, or earned by a firm's shareholders. |
| Deflation | The division of the nominal value of some aggregate by a general price index in order to revalue its quantities at the prices of the price reference period or to revalue the aggregate at the general price level of the price reference period. |
| Economically active person | A person of working age who is available for work and is either employed or is unemployed but takes active steps to find work in a given reference period. |
| Economic production | An activity carried out under the control and responsibility of an institutional unit that uses inputs of labour, capital, and goods and services to produce outputs of goods. |
| Economic rent | It represents the excess of total revenue over the opportunity cost of production and depicts the difference between the return made by a factor of production whose supply is fixed, i.e. perfectly inelastic, and the return necessary to keep this factor in its current occupation. It is an economic profit if made in a competitive environment. |
| Economies of scale | Decline in the average cost of production as output increases. |
| Elasticity of demand | The percentage change in quantity demanded resulting from a percentage change in price. The price elasticity of demand is influenced by consumer incomes, tastes, and the degree to which substitute products exist. |
| Employee | A person - permanently, temporarily or casually employed - who works upon agreed hours in his job. |
| Employer | A person or organisation that uses the services of one or more people for payment by cash and/or in-kind. |

Table L: Description of concepts (continued)

| Employment | An activity in which a person performs work for pay, profit or <br> family gain. Such a person can be self-employed, an employer, <br> an employee or a working family member. |
| :--- | :--- | :--- |
| Enterprise | An entity that directly controls all functions necessary to carry <br> out its activities as a producer of goods and services. It may be <br> a corporation, a quasi-corporation, a non-profit institution, or an <br> unincorporated enterprise. |
| Establishment | An enterprise that engages under a single ownership or control <br> on one or predominantly one kind of activity at a single location. |
| Expenditure | Consumption, which includes all cash expenditure and in-kind <br> provisions for goods and services incurred by households, <br> business, government, and non-profit institutions. It includes <br> imputed value for own produced items consumed. |
| Exports | The outward flow of goods and services destined for <br> consumption abroad. |
| General <br> government | Government units whose primary activity is to assume <br> responsibility for the provision of goods and services to the <br> community or to individual households free of charge or at <br> prices that are not economically significant and to redistribute <br> income and wealth by means of transfers. A defining <br> characteristic of general government is the ability to impose, <br> directly or indirectly, taxes and other compulsory levies. |
| Gross fixed <br> capital formation | The acquisition value of new and used fixed assets excluding <br> their sales. |
| Gross operating <br> surplus/mixed | The surplus generated by operating activities after <br> recompensing labour as factor input to production. It is <br> equivalent to economic rent, or the value of capital service flows <br> from an asset. |
| income | A producer unit in which only a single (non ancillary) productive <br> activity is carried out. |
| Homogeneous <br> production unit |  |

## Table L: Description of concepts (continued)

| Horizontal | A combination of two or more businesses within the same group |
| :--- | :--- |
| integration of |  |
| enterprise unit |  |$\quad$| or company structure operating together on the market as one |
| :--- |
| unit. |$|$| Formal sector | All employing businesses that are legally registered in any way. |
| :--- | :--- |
| Human capital | All the skills, knowledge and expertise that a workforce <br> accumulates over time to allow it to increase industry <br> productivity. |
| Imputation | The assignment of replacement values for missing, invalid or <br> inconsistent data by way of informed estimation following a <br> process of prescribed guidelines. |
| Implied/implicit | An implied deflator is a Paasche price index that is a by-product <br> of deflation. It represents an index of the general price level that <br> is obtained by dividing a series expressed in current prices by |
| deflator | the corresponding series in constant prices. An implicit deflator <br> is sometimes referred to as a "current weighted index". |
| Imports | The inward flow of goods and services destined as part of home <br> supply. |
| Income of | All money received from sales of goods, services rendered, <br> mineral rights leases, rental of land, buildings and other <br> structures, plant, machinery, and motor vehicles, interest and <br> dividends, royalties, franchise fees, copyright, trade names and <br> patent rights, government subsidies and incentives, net profit on <br> foreign loans, profit from redemption, liquidation or revaluation <br> of liabilities, and profit from the sale of realisation for cash or <br> revaluation. |
| Industry | Group of establishments engaged in the same or similar kinds of <br> activity based on the principal class of goods produced or <br> services rendered. |

Table L: Description of concepts (continued)

| Income of | All money received from salary, wages or own business; plus <br> money benefits from employer, such as contributions to medical aid <br> and pension funds; plus all money from other sources, such as <br> additional work activities, remittances from family members living <br> elsewhere, state pension or grant, other pensions or grants, income <br> from investments, etc. |
| :--- | :--- |
| Industry size | Denotes the magnitude of an industry with reference to total <br> industry output, or other measures of economic activity such as total <br> assets, sales revenue/turnover, and employment. |
| Industrial <br> activity | An economic activity resulting in a homogeneous set of products or <br> the same kind of services. |
| Inflation | The percentage increase in the level of a general price index from <br> one period to another. |
| Institutional | An aggregation of institutional units on the basis of the type of <br> producer depending on their principal activity and function, which <br> are considered to be indicative of their economic behaviour. <br> Institutional units are grouped together to form institutional sectors <br> on the basis of their principal functions, behaviour, and objectives. |
| sector |  |

## Table L: Description of concepts (continued)

| Liability | An obligation that requires one unit (the debtor) to make a <br> payment or a series of payments to the other unit (the creditor) in <br> certain circumstances specified in a contract between them. |
| :--- | :--- | :--- |
| Life cycle of <br> statistical unit | A series of states in the life of a statistical unit that can take the <br> following stages: "birthed", "activated", "deactivated", "reactivated" <br> or "ceased". |
| Manufacturing | The physical or chemical transformation of materials of <br> components into new products, whether the work is performed by <br> power-driven machines or by hand, whether it is done in a factory <br> or in the worker's home, and whether the products are sold at <br> wholesale or retail. Included are assembly of component parts of <br> manufactured products and recycling of waste materials. |
| Marginal cost | The increment or addition to total cost that results from producing <br> one more unit of output. |
| Market share | The proportion a firm holds in an industry. It is derived according <br> to total sales, capacity, or any other measure of industry size. |
| Merger | An event where two or more businesses are joined and a new <br> business is registered. The registered name of the new business <br> may be different from the registered name of all the original <br> businesses. The original businesses are ceased. |
| Overtime | The type of work a person does. <br> agreed hours. |
| Opportunity | The amount lost by not using an asset or resource in its best <br> alternative use. <br> cost <br> goods and services produced for own final use. |
| become available for use outside the establishment, plus any |  |

## Table L: Description of concepts (continued)

| Ownership of <br> business | The manner in which a business is managed and controlled. <br> Examples include, sole proprietorship, partnership, corporation and <br> business trust. |
| :--- | :--- |
| Paasche <br> index | A form of index number where prices, quantities or other units of <br> measurement over time are weighted according to their current <br> period values. It is also called a "current weighted index". |
| Principal <br> activity | The activity whose gross value added exceeds that of any other <br> activity carried out within the same unit/enterprise. |
| Producer | A measure of the change in the prices of goods and services either <br> as they leave their place of production or as they enter the <br> production process. The PPI is designed to measure the average <br> change (between periods) in output prices due to changes in the <br> basic prices received by producers or, alternatively, the change in <br> prices paid by producers for inputs of goods and services used in <br> the production of output. The PPI is a Laspeyers (fixed-weight) price <br> index. |
| (PPI) | An activity resulting in a product. A process without any human <br> involvement or direction is not production in an economic sense. |
| Production | The ability to transform inputs into output.  <br> Productivity Tangible items purchased by an entity primarily with the intention of <br> selling them to customers. Purchases include: raw materials, <br> components used in production, fuels for off-road vehicles, spare <br> parts and building materials; and purchases and transfers-in of <br> factored goods, intermediate products and partially completed goods <br> from related enterprises. <br> Purchases Realized earnings from invested capital. It shows how much is <br> earned per Rand of invested capital. <br> Reactivated Life status of a statistical unit which has restarted its operations. <br> Real price The absolute price of a good or service relative to an aggregate <br> measure of prices. |

Table L: Description of concepts (continued)

| Real value | The value of a variable expressed in real prices. It is obtained by deflating the value in nominal/current prices with a general price index. When this deflation is fixed to a particular year the real price is called constant price and the resultant real values are in constant prices. See volume index. |
| :---: | :---: |
| Re-exports | Foreign goods exported in the same state as previously imported |
| Replacement cost | The long-run cost of buying a comparable quality asset. |
| R\&D expenditure | Intramural current expenditure, including overheads, and intramural capital expenditure spent on creative work undertaken on a systematic basis to increase the stock of knowledge and the use of this knowledge to devise new applications. |
| Reserves | The amount set aside out of surpluses, which is not designed to meet any liability, contingency, commitment or diminution in the value of assets. |
| Revaluation | An increase or decrease in the value of a currency, or of fixed assets, typically freehold land and buildings, that depicts resultant gains or losses. |
| Sales | The total value of earnings and transfers-out of all own manufactured products and the amounts received for installation, erection, assembly or other services rendered. |
| Sampling | Drawing out from a population in such a way that the drawn out sample is representative of the population. |
| Secondary industries | Comprise the manufacturing, electricity, water and construction industries. |
| Standard Industrial Classification of all Economic Activities | System that classifies businesses according to their economic activities. |
| Statistical unit | A unit of observation or measurement for which statistical data are collected or derived |

## Table L: Description of concepts (continued)

| Subsidies | Current unrequited payments that government units, including <br> non-resident government units, make to enterprises on the <br> basis of the levels of their production activities or the <br> quantities or values of the goods or services which they <br> produce, sell or import. These transfers represent additions to <br> the income of enterprises. |
| :--- | :--- | :--- |
| Substitution effect | The switch in spending under a constant purchasing power to <br> or from a product when its relative price changes in relation to <br> its replacement. |
| Takeover | An event where one or more business is absorbed by another <br> business or businesses. |
| Tax | A compulsory transfer of money or occasionally of goods and <br> services from individuals, institutions or groups to the State. |
| Technology | The knowledge about available techniques depicting the <br> combination of factors used to produce goods and services. A <br> technique is characterized in terms of capital intensity. |
| Trading gain or loss | The real gain from foreign trade. It can be derived in one of <br> two ways: <br> (a) as the difference between real gross domestic income and <br> real gross domestic product; or <br> (b) by subtracting the value of imports from the value of <br> exports after deflation. Where there is uncertainty about the <br> choice of deflator, an average of the import and the export <br> price indices provides a suitable deflator. |
| Transfer in-kind | A transaction in which one institutional unit provides goods, <br> services or assets to another unit without receiving from the <br> latter any goods, services or assets in return as counterpart. |
| Talue added | The transfer of the ownership of a good or an asset other than <br> cash, or the provision of a service. |
|  | Those activities or steps which add to or change a product or <br> service as it goes through a process; these are the activities <br> or steps that customers view as important and necessary. |

## Table L: Description of concepts (concluded)

| Vertical <br> integration of <br> economic <br> activities | The case where the different stages of production are carried out in <br> succession by the same unit and where the output of one process <br> serves as input to the next. |
| :--- | :--- |
| Vertical <br> integration of <br> enterprise unit | A combination of enterprise units that are operating in such a way <br> that the production of one enterprise is consumed totally by <br> another enterprise within the same group or company structure. |
| Volume index | An index that describes changes in volume. It is obtained when <br> price change is removed from a nominal value by means of <br> deflation through a general price index. To get to a volume index <br> the nominal value is divided by a price index and the obtained <br> quotient is multiplied by one hundred. A volume index can also be <br> produced directly from quantity data without deflation with a price <br> index. With a Paasche price index as deflator, a Laspeyers-type <br> volume index is derived. With a Laspeyers price index as deflator, <br> a Paasche-type volume index is derived. Both isolate changes in <br> price differently. The former captures changes in quantity by <br> holding prices constant to a past period. The latter captures <br> changes in quantity by holding prices constant to a current period. |

## Questionnaire

In order to improve the quality and relevance of the Compendium of Industrial Statistics it would be useful to receive the views of users of this publication. It would therefore be appreciated if you could complete the following questionnaire and return it by email or fax to:

Socio-Economic Integration Unit
Statistics South Africa
Pretoria
South Africa
E-mail: sei@statssa.gov.za
Fax: 0865352864 (Domestic); +27 865352864 (International)

1. Name and address of respondent:
2. Which of the following describes your area of work?

Government $\qquad$
Private enterprise $\qquad$
Public enterprise $\qquad$
Academic or research institution $\qquad$
International organisation $\qquad$
Media $\qquad$
Not-for-profit organisation_
Other
(specify) $\qquad$
3. In which country do you work?
4. What is your assessment of the contents of this publication?
Excellent $\qquad$ Good
Adequate $\qquad$ Poor
5. How useful is this publication to your work?

Very useful $\qquad$ Somewhat useful $\qquad$ Irrelevant_
6. Please indicate the three things you liked best about this publication:
7. Please indicate the three things you liked least about this publication:

Thank you
