SUMMARY OF FINDINGS: MANUFACTURING PRODUCTION AND SALES

Table A – Selected key figures regarding manufacturing production and sales for March 2010

| Actual estimates | March 2010 | % change between March 2009 and March 2010 | % change between January to March 2009 and January to March 2010 |
|--|------------|--|---|
| Physical volume of manufacturing production index (2005=100) | 105,1 | 6,3 | 4,3 |
| Total estimated sales of manufactured products (R million) | 106 938 | 5,1 | 2,8 |
| Seasonally adjusted estimates | March 2010 | % change between February and March 2010 | % change between October to December 2009 and January to March 2010 |
| Physical volume of manufacturing production index (2005=100) | 102,5 | 2,6 | 1,5 |
| Total estimated sales of manufactured products (R million) | 104 744 | 4,4 | 2,5 |

Key findings regarding manufacturing production for the first quarter of 2010

Manufacturing production for the first quarter of 2010 reflected an increase of 4,3% compared with the first quarter of 2009. Higher production for the first quarter of 2010 was reported by five of the ten manufacturing divisions.

The annual increase of 4,3% was mainly due to higher production in the motor vehicles, parts and accessories and other transport equipment division (25,4% and contributing 2,2 percentage points), the basic iron and steel, non-ferrous metal products, metal products and machinery division (10,1% and contributing 2,0 percentage points), the petroleum, chemical products, rubber and plastic products division (3,5% and contributing 0,9 of a percentage point) and the food and beverages division (2,5% and contributing 0,4 of a percentage point) (see Table 9).

Seasonally adjusted production

The seasonally adjusted manufacturing production for the first quarter of 2010 increased by 1,5% compared with the fourth quarter of 2009. Higher production levels were reported by six of the ten manufacturing divisions during this period.

The increase was driven by higher production in the basic iron and steel, non-ferrous metal products, metal products and machinery division (2,7% and contributing 0,6 of a percentage point), the wood and wood products, paper, publishing and printing division (5,9% and contributing 0,5 of a percentage point), the motor vehicles, parts and accessories and other transport equipment division (5,2% and contributing 0,5 of a percentage point), the petroleum, chemical products, rubber and plastic products division (1,4% and contributing 0,3 of a percentage point), the electrical machinery division (6,3% and contributing 0,2 of a percentage point) and the furniture and other manufacturing division (1,6% and contributing 0,1 of a percentage point). However, these increases were partially counteracted by decreases reported by the food and beverages division (-2,4% and contributing -0,4 of a percentage point) and the glass and non-metallic mineral products division (-4,0% and contributing -0,2 of a percentage point) (see Table B).

Key findings regarding manufacturing production for March 2010

Estimated actual production

The estimated manufacturing production for March 2010 increased by 6,3% compared with March 2009.

The 6,3% increase in manufacturing production in March 2010 compared with March 2009 was due to higher production in the motor vehicles, parts and accessories and other transport equipment division (24,3% and contributing 2,2 percentage points), the basic iron and steel, non-ferrous metal products, metal products and machinery division (9,5% and contributing 1,9 percentage points), the petroleum, chemical products, rubber and plastic products division (7,6% and contributing 1,8 percentage points), the food and beverages division (6,3% and contributing 1,1 percentage points) and the electrical machinery division (5,6% and contributing 0,2 of a percentage point) (see Table 4b).

Table B – Contribution of manufacturing divisions and major groups to the total three-monthly seasonally adjusted manufacturing production**Base 2005=100**

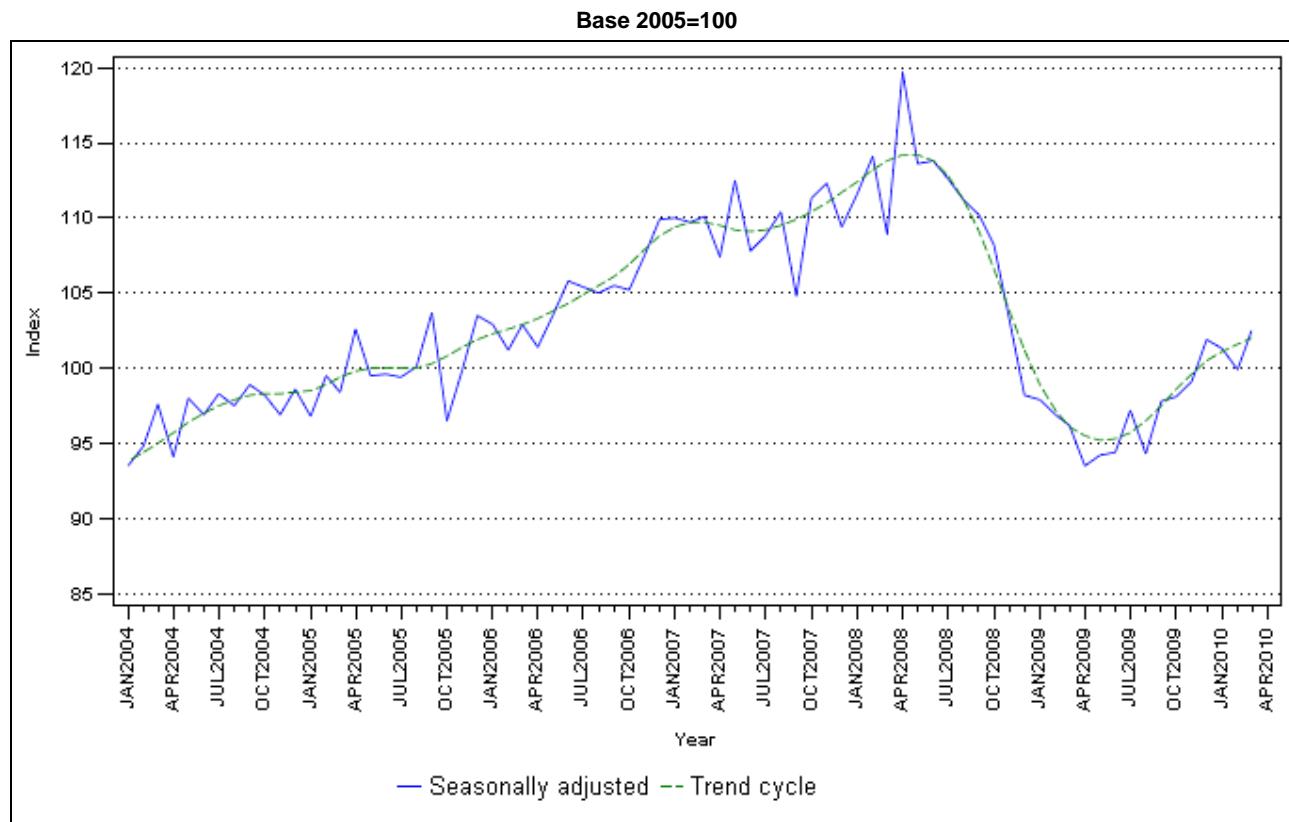

| Manufacturing divisions and major groups | Percentage contribution to total manufacturing production using the weights according to the large sample survey of the manufacturing industry, 2005 | Average seasonally adjusted production index for October to December 2009 | Average seasonally adjusted production index for January to March 2010 | Quarterly percentage change of January to March 2010 compared with the preceding three months | Contribution (percentage points) to the seasonally adjusted quarterly percentage change in total manufacturing production |

| Total | 100,0 | 99,7 | 101,2 | 1,5 | 1,5 |

1/ The contribution (percentage points) of a major group or division to the total seasonally adjusted manufacturing production is calculated by multiplying the difference in the index of the major group or division by the weight of the major group or division and then dividing by the previous period total manufacturing index.

Figures have been rounded off.

Figure 1 shows the seasonally adjusted and trend series for the volume index of manufacturing production between January 2004 and March 2010.

Figure 1 – Index of the physical volume of manufacturing production: 2004 – 2010

Key findings regarding sales of manufactured products

The estimated total value of sales of manufactured products at current prices for the first quarter of 2010 increased by 2,5% (R7 383 million), after seasonal adjustment, compared with the fourth quarter of 2009. Higher manufacturing sales were reported by six of the ten manufacturing divisions during this period (see Table C).

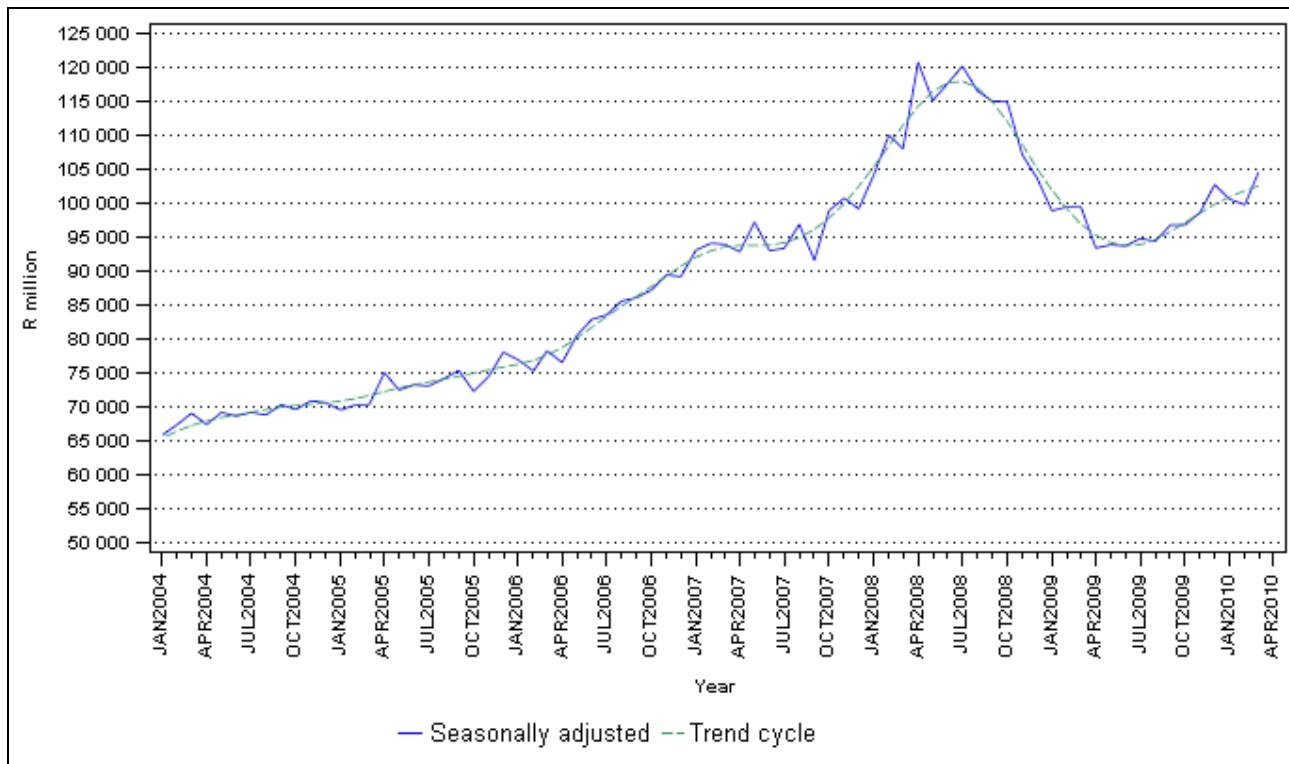

Large increases were mainly reported for the basic iron and steel, non-ferrous metal products, metal products and machinery division (7,3% or R4 197 million), the petroleum, chemical products, rubber and plastic products division (3,2% or R2 246 million), the wood and wood products, paper, publishing, rubber and plastic products division (4,8% or R1 191 million) and the motor vehicles, parts and accessories and other transport equipment division (3,8% or R1 468 million) during the above-mentioned period (see Table C).

Table C – Contribution of manufacturing divisions and major groups to the total three-monthly seasonally adjusted sales of the manufacturing industry at current prices

| Manufacturing divisions and major groups | Seasonally adjusted sales October to December 2009 | Seasonally adjusted sales January to March 2010 | Percentage change between October to December 2009 and January to March 2010 | Difference in seasonally adjusted sales of manufacturing divisions between October to December 2009 and January to March 2010 |

| -Furniture | 1,3 | 78,2 | 76,7 | -1,9 | 0,0 | 2 394 | 2 395 | 0,0 | 1 |
| -Other manufacturing groups | 3,9 | 97,0 | 97,1 | 0,1 | 0,0 | 10 782 | 11 040 | 2,4 | 258 |
| Total | 100,0 | 91,6 | 95,5 | 4,3 | 4,3 | 279 497 | 287 184 | 2,8 | 7 687 |

1/ The contribution (percentage points) of a major group or division is calculated by multiplying the difference in the index of the major group or division by the weight of the major group or division and then dividing by the previous period total manufacturing index.
Figures have been rounded off.

Explanatory notes

- Introduction**
- 1 Statistics South Africa (Stats SA) conducts a monthly survey of the manufacturing industry, covering manufacturing enterprises. This statistical release contains the results of a sample drawn from the Business Register (BR), with enhanced coverage of South African businesses (see 4 below). The release contains monthly indices of the physical volume of manufacturing production and monthly value of sales of manufactured products by divisions and major groups within manufacturing.
 - 2 In accordance with international practice, the indices are re-based every five years to a new base year. The base period of the index is 2005. Both estimated and seasonally adjusted figures are presented.
 - 3 In order to improve timeliness, some information for the latest month had to be estimated for respondents who have not reported by the cut-off date for production of results. These estimates will be revised in future statistical releases when their reported information becomes available.
 - 4 As indicated earlier, Stats SA is continuously upgrading its BR, based on units registered for value added tax (VAT) and income tax (IT), obtained from the South African Revenue Service (SARS).
- Purpose of the survey**
- 5 The results of the monthly manufacturing production and sales survey are used to calculate indices of the physical volume of manufacturing production. These indices provide an indicator of the real level of manufacturing activity in the economy. They are used in monitoring the state of the economy and formulation of economic policy. They are also important inputs to estimation of the gross domestic product (GDP).
- Special Data Dissemination Standard of the IMF**
- 6 The data in this statistical release adhere to the Special Data Dissemination Standard (SDDS) of the International Monetary Fund (IMF), which sets out standards on coverage, periodicity and timeliness of data, access by the public, integrity, and quality of the disseminated data.
- Scope of the survey**
- 7 This survey covers manufacturing enterprises, i.e. those conducting activities in -
 - the manufacturing, processing, making or packing of products;
 - the slaughtering of animals, including poultry; and
 - installation, assembly, completion, repair and related work.
- Classification**
- 8 The 1993 edition of the *Standard Industrial Classification of all Economic Activities (SIC)*, Fifth Edition, Report No. 09-90-02, was used to classify the statistical units in the survey. The SIC is based on the 1990 *International Standard Industrial Classification of all Economic Activities (ISIC)* with suitable adaptations for local conditions. Each enterprise is classified to an industry which reflects its predominant activity. Statistics in this publication are presented at SIC division (two digit) and major group (three digit) level.
- Response rate**
- 9 The preliminary response rate for the survey on manufacturing production and sales for March 2010 was 90,3%. Improved response rate for February 2010 was 92,9%.
- Statistical unit**
- 10 The statistical unit for which information is compiled and published is the enterprise, defined as a legal unit or a combination of legal units that includes and directly controls all functions necessary to carry out its production activities. The statistical units are derived from and linked to the South African Revenue Service (SARS) administrative data.

- | | |
|--------------------------------------|--|
| Survey methodology and design | <p>11 The survey is conducted monthly. Questionnaires are sent to a sample of 3 049 enterprises. Completed questionnaires are required to be returned to Stats SA within 10 days after the end of the reference month. Fax and telephone reminders are used to follow up non-respondents.</p> <p>12 The value of sales of manufactured products is obtained monthly from the sample of 3 049 enterprises, which was drawn in April 2009 from a population then of 57 398 manufacturing enterprises. Each manufacturing major group is divided into four size groups. The sample is drawn at the SIC three-digit level. All large enterprises (size group one), are completely enumerated. Simple random sampling is applied for size group two (medium sized) enterprises, and for size groups three and four (small) enterprises. The total value of sales of manufactured products of large enterprises (size group one) in a major group is added to the weighted totals of size groups two, three and four of that major group to reflect the total value of sales of the major group.</p> <p>13 The calculation of the monthly production indices is based on the value of sales of products and articles manufactured and change in monthly value of stocks of manufactured products, after the effect of price changes has been eliminated through deflation using appropriate indices of the Production Price Index (PPI). For 38 of the 44 major groups in manufacturing, the value of production is calculated from the value of sales and stocks of manufactured products obtained from the monthly survey of manufacturing enterprises.</p> <p>14 More direct indicators are used for the value of production of tobacco, coke and refined petroleum products, basic iron and steel products, basic precious and non-ferrous metal products, motor vehicles and parts and accessories for motor vehicles. The volume indices for these major groups are calculated on the basis of physical quantities. This method is used by the national statistical agencies of many other countries for petroleum products as the results are considered more satisfactory (mainly because these commodities are relatively homogeneous).</p> |
| Weighting methodology | <p>15 For those strata not completely enumerated, the weights to produce estimates are the inverse ratio of the sampling fraction, modified to take account of non-response in the survey. Stratum estimates are calculated and then aggregated with the completely enumerated stratum to form major group and division estimates. These procedures, which are in line with international best practice, are described in more detail on the Stats SA website at www.statssa.gov.za/publications/publicationsearch.asp.</p> <p>16 For indices, a weight is calculated for every major group according to the value added of the major group relative to the total value added of the manufacturing industry as a whole, based on the results of the most recent census of manufacturing or large sample survey of the manufacturing industry. For the period 1998 to 2000, the weights are based on the 1996 Census of Manufacturing. For the period 2001 to 2004, the weights are based on the 2001 large sample survey of the manufacturing industry (LSS) and for the period 2005 to 2010, the weights are based on the 2005 LSS. Weights between census / LSS years are fixed. The production indices of all divisions are multiplied by the applicable weights and aggregated to produce the index for the total physical volume of manufacturing production (see Table D for the fixed weights which were used for the three periods 1998 to 2000, 2001 to 2004 and 2005 to 2010).</p> |
| Seasonal adjustment | <p>17 Seasonally adjusted estimates of all major groups are generated each month, using the X-11 Seasonal Adjustment Program developed by the US Bureau of the Census, 1968. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove irregular or non-seasonal influences, which may be present in any particular month. Influences that are volatile or unsystematic can still make it difficult to interpret the movement of the series even after adjustment for seasonal variations. Therefore the month-to-month movements of seasonally adjusted estimates may not be reliable indicators of trend behaviour.</p> |

- Trend cycle** 18 The trend is the long-term pattern or movement of a time series. The X-11 Seasonal Adjustment Programme is used for smoothing seasonally adjusted estimates to estimates of the underlying trend cycle.
- Reliability of estimates** 19 Data presented in this publication are based on information obtained from a sample and are, therefore, subject to sampling variability; that is, they may differ from the figures that would have been produced if the data had been obtained from all enterprises in the manufacturing industry in South Africa. Estimates are subject to sampling and non-sampling errors.
- 20 Inaccuracies may occur because of imperfections in reporting by enterprises and errors made in the collection and processing of the data. Inaccuracies of this kind are referred to as non-sampling errors. Every effort is made to minimise non-sampling errors by careful design of questionnaires, testing them in pilot studies, editing reported data and implementing efficient operating procedures. Fluctuations may occur in consecutive months as a result of seasonal and economic factors.
- Revised figures** 21 Revised figures are due to late submission of data to Stats SA, or to respondents reporting revisions or corrections to their figures. Preliminary figures are indicated in the relevant tables. Data are edited at the enterprise level.
- Related publications** 22 Users may also wish to refer to the following publications available from Stats SA -
- *Bulletin of Statistics* issued quarterly.
 - *SA Statistics* issued annually.
- Rounding-off of figures** 23 Where necessary, the figures in the tables have been rounded off to the nearest digit shown. There may, therefore, be slight discrepancies between the sums of the constituent items and the totals shown.
- Pre-release policy** 24 Stats SA's pre-release policy may be inspected at its website, www.statssa.gov.za

Technical notes**26 Neyman optimal allocation**

Before drawing a sample in the survey the population of enterprises on the BSF was stratified. Strata were formed using a combination of Standard Industrial Classification variable and the measure of size variable for enterprises. The Neyman optimal allocation formula used to allocate samples to each stratum is given by a formula below.

$$n_h = \frac{N_h S_h}{\sum N_h S_h}$$

N_h and S_h are the stratum population size and the stratum variance respectively.

Class limits: Manufacturing

| Enterprise size | Lower limits | Upper limits |
|-----------------|--------------|--------------|
| Very small | 0 | 12 500 000 |
| Small | 12 500 001 | 32 500 000 |
| Medium | 32 500 001 | 127 500 000 |
| Large | 127 500 001 | |

Glossary

| | |
|---|---|
| Enterprise | The enterprise is a legal entity or a combination of legal units that includes and directly controls all functions necessary to carry out its production activities. |
| Index of physical volume of manufacturing production | The index of physical volume of manufacturing production, also known as a production index, is a statistical measure of the change in the volume of production. The production index of a major group is the ratio between the volume of production of a major group in a given period and the volume of production of the same major group in the base period. The base period is 2005. The production in the base period is set at 100. |
| Industry | An industry is made up of enterprises engaged in the same or similar kinds of economic activity. Industries are defined in the <i>System of National Accounts (SNA)</i> in the same way as in the <i>1993 Standard Industrial Classification of all Economic Activities</i> , Fifth Edition, Report No. 09-90-02 of January 1993 (SIC). |
| Intermediate consumption | <p>Intermediate consumption includes -</p> <ul style="list-style-type: none"> • purchases and transfers-in of materials; • payments to other establishments for work done; • other direct factory costs; • rent and leasing paid; • head office charges; • royalties, copyright, trade names and patent rights paid; • advertising; • insurance premiums; • services; and • secretarial and administrative fees. |
| Output | <p>Output is the aggregate value of goods manufactured and work done and includes -</p> <ul style="list-style-type: none"> • sales and transfers-out of own manufactures, factory waste and stocks of factored goods; • repairs; • installation, erection and assembly; • sundry trading revenue; • sales of factored goods minus purchases of factored goods; • rent and leasing received; • royalties received; • difference between opening value and closing value of work in progress, stocks of own manufactures and stocks of factored goods; • head office charges; and • other revenue. <p>Output excludes excise and customs duty paid.</p> |
| Value added | Value added is the value of output less intermediate consumption. It represents the value added to the cost of the materials used in the process of production. |
| Sales | Sales are the total value of sales and transfers-out of all own manufactured products/articles and the amounts received for installation, erection or assembly or other services rendered. |
| Turnover | <p>Turnover refers to -</p> <ul style="list-style-type: none"> • the value of sales and transfers out of all own manufactured products/articles; • amounts received for work done; and • amounts received for services rendered. |

Turnover excludes -

- value added tax (VAT);
- export freight charges; and
- excise duty.

Weight

The weight of a major group of manufacturing in the overall index for manufacturing is the ratio of the value added of the major group (i.e. output of a major group minus intermediate consumption) to the total value added of the manufacturing industry. The weight reflects the importance of the major group in the total. The weights change over time due to changes in the relative performance of industries, due to factors such as quality changes, changes in relative prices, and changes in customer preferences. New weights need to be calculated from time to time.

Table D – Weights according to manufacturing divisions and major groups

| Manufacturing divisions and major groups | Weights according to the 1996 Census of Manufacturing 1998 - 2000 | Weights according to the 2001 LSS of the manufacturing industry 2001 - 2004 | Weights according to the 2005 LSS of the manufacturing industry 2005 - 2010 |
|---|--|--|--|
| Food and beverages | 15,3 | 16,4 | 15,4 |

General information

Stats SA publishes approximately 300 different statistical releases each year. It is not economically viable to produce them in more than one of South Africa's eleven official languages. Since the releases are used extensively, not only locally but also by international economic and social-scientific communities, Stats SA releases are published in English.

Stats SA has copyright on this publication. Users may apply the information as they wish, provided that they acknowledge Stats SA as the source of the basic data wherever they process, apply, utilise, publish or distribute the data; and also that they specify that the relevant application and analysis (where applicable) result from their own processing of the data.

Advance release calendar

An advance release calendar is disseminated on www.statssa.gov.za
