Chapter 1: Introduction

1.1 Overview

Censuses are a principal means of collecting basic population and housing statistics required for social and economic development, policy interventions, their implementation and evaluation. South Africa has conducted three censuses (1996, 2001 and 2011). Census 2011 was the third census to be conducted since the post-democratic elections in 1994, and a number of population and household attributes were measured and a variety of indicators generated. This chapter provides information on how the count was done.

1.2 How the count was done

Census 2011 was conducted from 9 to 31 October 2011. This section focuses on the various activities that were carried out prior to the finalisation of the results. They can be summarised as follows: Planning, pre-enumeration, enumeration, processing and editing.

1.2.1 Planning

This process involved the development of the overall strategy, the structure for the project, component plans and budget. These processes were started in 2003 and were subsequently reviewed in 2008, after the completion of the Community Survey (CS) in 2007. Methodologies and procedures were then developed and tested in a form of mini-tests and a pilot in 2008 and 2009 respectively. The findings from these tests helped to refine the plans and methods for the final test in 2010 called the “Dress Rehearsal”. The latter was expected to be a replica of how the actual count was to be conducted in 2011, and therefore the timing had to be the same month as the main census, i.e. October month.

1.2.2 Pre-enumeration

The pre-enumeration phase mainly involved the final preparatory work before the actual count. It started with mass production of census instruments like questionnaires, manuals, field gear, etc. The phase also involved acquisition of satellite offices required in the districts, recruitment of the first level of field management staff (District Census Coordinators – 130 DCCs; and Fieldwork Coordinators – 6 000 FWCs). These groups of people were then given intense training based on their key performance areas. At the same time, the country was sub-divided into small pockets called enumeration areas (EAs). The underlying principle for this sub-division is that an EA should be within reach of a Fieldworker and all households in that EA can be covered within the allocated number of days. This process yielded 103 576 EAs. The other benefit for this sub-division is the finalisation of the distribution plan of all materials required in the provinces and districts. It also gives a better estimate of the number of field staff to recruit for the count. The pre-enumeration phase involved over 7 000 staff.

1.2.3 Enumeration

The enumeration phase started with the training of supervisors as listers. Each person had to list all dwellings within an EA and had a minimum of four EAs to cover. These areas were called supervisory units. As they were listing, they were also expected to publicise the activities of the Census 2011 within their supervisory units. Upon completion of listing, final adjustments of workload and number of enumerators required were finalised. Training of enumerators started in earnest, and it mainly covered how to complete the questionnaire and to read a map. The latter was to aid them to identify the boundaries of their assigned areas. Enumerators were also given a few days before the start of the count to update their orientation book with any developments that might have happened since listing, as well as to introduce themselves to the communities they were to work with, through posters bearing their photos and special identification cards. On the night of 9 October, the actual count started with the homeless and special institutions given special attention. The enumeration phase was undertaken by an army of field staff in excess of 160 000, including management.

1.2.4 Data processing

The processing of over 15 million questionnaires commenced in January 2012, immediately after the completion of the reverse logistics in December 2011. Each box and its contents were assigned a store location in the processing centre via a store management system. Each time a box was required for any process it was called through this system. The processing phase was sub-divided into the following processes: *primary preparation* – where all completed questionnaires were grouped into clusters of 25 and the spine of the questionnaire cut off; *Secondary preparation* – where questionnaires were finally prepared for scanning, by removing foreign materials in between pages and ensuring that all pages are loose; *Scanning* – questionnaires were put through a scanner to create an electronic image; and finally, *Tiling and completion* – where any unrecognised reading/badly-read image by the scanner had to be verified by a data capturer. This process took eight months. Over 2 000 data processors working three shifts per day were employed for this phase to ensure that 225 million single pages were accounted for.

1.2.5 Data editing and validation system

The execution of each phase of the census operations introduces some form of errors in census data. Despite quality assurance methodologies embedded in all the phases, i.e. data collection, data capturing (both manual and automated), coding, and editing, a number of errors creep in and distort the collected information. To promote consistency and improve data quality, editing is a paramount phase in identifying and minimising errors such as invalid values, inconsistent entries or unknown/missing values. The editing process for Census 2011 was based on defined rules (specifications).

The editing of Census 2011 data involved a number of sequential processes: selection of members of the editing team, review of Census 2001 and 2007 Community Survey editing specifications, development of editing specifications for the Census 2011 pre-tests (2009 pilot and 2010 Dress Rehearsal), development of firewall editing specifications, and finalisation of specifications for the main census.

1.2.5.1 Editing team

The Census 2011 editing team was drawn from various divisions of the organisation based on skills and experience in data editing. The team thus comprised subject matter specialists (demographers and programmers), managers and data processors.

1.2.5.2 Role of the team

Among other census activities, editing team roles and responsibilities included:

- Establishment of editing plan/schedule
- Formulation and application of clear and concise editing specifications
- Validation of census data using other data sources
- Ensuring of consistency of editing rules between censuses (2001 and 2011) where applicable
- Provision of imputation flags and rates
- Identification of errors and providing corrections where possible
- Review and refinement of the edit specifications based on edit trial evaluations, cross tabulations, and comparison of census data with other datasets
- Testing the specifications before confirming and applying them

The editing specification process commenced with activities relating to the review of existing editing specifications guidelines. Census 2001 specifications as well as Community Survey 2007 survey specifications and the UN handbook on Census editing were reviewed to form the basis of the specifications.

1.2.5.3 Editing strategy for Census 2011

The Census 2011 questionnaire was very complex, characterised by many sections, interlinked questions and skipping instructions. Editing of such complex, interlinked data items required application of a combination of editing techniques. Errors relating to structure were resolved using structural query language (SQL) in Oracle dataset. CSPro software was used to resolve content related errors. The strategy used for Census 2011 data editing was the implementation of automated error detection and correction with minimal changes. Combinations of logical and dynamic imputation were used. Logical imputations were preferred, and in many cases, substantial effort was undertaken to deduce a consistent value based on the rest of the household's information. To profile the extent of changes in the dataset and assess the effects of imputation, a set of imputation flags are included in the edited dataset. Imputation flags values include the following:

- 0 no imputation was performed; raw data were preserved
- 1 logical editing was performed; raw data were blank
- 2 logical editing was performed; raw data were not blank
- 3 hot-deck imputation was performed; raw data were blank
- 4 hot-deck imputation was performed; raw data were not blank

1.2.6 Independent monitoring and evaluation of census field activities

Independent monitoring of the Census 2011 field activities was carried out by a team of 31 professionals and 381 monitoring and evaluation monitors from the Monitoring and Evaluation division. These included field training, publicity, listing and enumeration. This was to make sure that the activities were implemented according to the plans and had independent reports on the same. They also conducted Census 2011 and the post-enumeration survey (PES) verification studies to identify the out-of-scope cases within census (a sample of 7 220 EAs) and the PES sample (600 EAs) as reported in the Census 2011 PES EA Summary Books.

1.2.7 Post-enumeration survey (PES)

A post-enumeration survey (PES) is an independent sample survey that is conducted immediately after the completion of census enumeration in order to evaluate the coverage and content errors of the census. The PES for Census 2011 was undertaken shortly after the completion of census enumeration, from November to December 2011, in approximately 600 enumeration areas (EAs), which later increased to 608 due to subdivision of large EAs. The main goal of the PES was to collect high quality data that would be compared with census data in order to determine how many people were missed in the census and how many were counted more than once.

A population census is a massive exercise, and while every effort is made to collect information on all individuals in the country, including the implementation of quality assurance measures, it is inevitable that some people will be missed and some will be counted more than once. A PES assists in identifying the following types of errors:

- Coverage error: this includes both erroneous omissions (e.g. a household that was not enumerated) and erroneous inclusions (e.g. a household that moved into the enumeration area (EA) after census but was still enumerated, or a household that was enumerated more than once).
- Content error: this refers to the errors on the reported characteristics of the people or households enumerated during census.

The errors may emanate from the following reasons:

- Failure to account for all inhabited areas in the EA frame;
- EA boundary problems;
- Incomplete listing of structures and failure to identify all dwellings within an EA;
- Failure to enumerate/visit all listed dwellings within an EA;
- Failure to identify all households within a dwelling unit in instances whereby a dwelling unit has more than one household;
- Failure to enumerate households (complete questionnaires) for all households due to refusals, unreturned questionnaires for self-enumeration, inability to contact households, etc.);
- Failure to include all individuals within households;
- Failure to observe the inclusion rule based on a person's presence on Census night (i.e. failure to apply the de facto rule accurately); and
- Lost questionnaires or damaged questionnaires that could not be processed.

Usually more people are missed during a census, so the census count of the population is lower than the true population. This difference is called net undercount. Rates of net undercount can vary significantly for different population groups depending on factors such as sex, age and geographic location. Stats SA obtains estimates of the net undercount, including the type and extent of content errors (reported characteristics of persons and households enumerated in the census) using information collected through the PES.

1.2.7.1 Preparations for the PES

Planning involved the development of documents outlining the goal and objectives of the PES, timelines of the project, identification of resources (financial, human and otherwise) required for implementing the project, and the development of methodology documents. Timelines for the PES were synchronised with those of Census 2011 to ensure the relevance of the project, and adhered to international best practice for maintaining a closed population between census and PES data collection, i.e. it should be carried out within a few months, preferably within six months, after the completion of census fieldwork to ensure that the impact of natural population changes, such as births, deaths and migration, as well as lapses in respondent recall do not complicate the exercise. Activities of the PES included the following:

- Sampling: sample design and selection;
- Development of data collection methodologies: methods and procedures for data collection (publicity, listing and enumeration), including quality control measures applied during data collection;
- Development of matching and reconciliation procedures and systems: guidelines for matching, including rules for determining the match status of households and individuals, as well as computer-based system for capturing household and person records for matching purposes;

- Questionnaire development: selection of data items which allowed measurement of coverage and content, including layout design and printing of questionnaire;
- Data collection: publicity, listing and enumeration of households in selected enumeration areas (EAs);
- Matching and reconciliation: office matching (comparison) of census and PES household and person records, and revisits to households in order to confirm or get more information that might assist in matching unresolved cases; and
- Analysis and reporting: compilation of tables and report on PES results.

1.2.7.2 Methodology

The PES is an independent survey that replicates the census in sampled enumeration areas (EAs). The major assumption used in the PES is that the census and the PES are independent, the estimate of the percentage missed by the PES but found by the census, and the percentage missed by the census but found by the PES, can be used to construct estimates of the percentage missed by both PES and census. The PES sought to estimate the total number of persons and households in housing units on the night of 09–10 October 2011 (Census night). The units of observation were the persons who spent the Census night and/or the PES night in these living quarters.

1.2.7.3 Sampling

The sampling frame for the PES was the complete list of Census 2011 EAs, amounting to 103 576 EAs. The primary sampling units (PSUs) were the Census EAs. The principle for selecting the PES sample is that the EA boundaries for sampled EAs should have well-defined boundaries, and these boundaries should correspond with those of Census EAs to allow for item-by-item comparison between the Census and PES records. The stratification and sampling process followed will allow for the provision of estimates at national, provincial, urban (geography type = urban) and non-urban (geography type = farm and traditional) levels, but estimates will only be reliable at national and provincial levels. The sample of 600 EAs was selected and allocated to the provinces based on expected standard errors which were based on those obtained in PES 2001. Populations in institutions (other than workers' hostels), floating and homeless individuals were excluded from the PES sample.

1.2.7.4 Questionnaire development

The approach to questionnaire design focused on capturing the main elements for measuring coverage and content errors. Only a few elements from the Census 2011 questionnaire which were not likely to change within a short period (that is between the census and the PES reference nights) were retained. The questionnaire allowed for the classification of each listed person as 'non-mover', 'in-mover', 'out-mover', or 'out-of-scope', with regard to their household presence status on Census night (09–10 October 2011). The data items for the PES questionnaire included first name and surname, date of birth, age, sex, population group and presence of person in dwelling unit on Census and/or PES night.

1.2.7.5 Fieldwork methodology

The PES replicated the census in the sampled EAs, which meant that all methodologies and procedures for data collection were based on census methodologies and procedures. PES fieldwork was split into the following three phases; publicity and listing, enumeration and mop-up operations.

- Publicity and listing were conducted at the same time. Publicity focused on informing and educating respondents and relevant stakeholders about the purpose of the PES to ensure successful coverage of all dwelling units (DUs) in selected EAs. Listing involved the recording of all structures (including all DUs, number of households in DUs and number of persons in households) in the sampled EAs in the EA Summary Books.
- Enumeration involved interviewing respondents and recording responses in the fields provided in the PES questionnaire. Self-enumeration for the PES was discouraged, but was used in instances where the respondent insisted on self-enumeration.
- Mop-up operations were conducted in the form of follow-up visits by senior field staff to households that could not be contacted during the enumeration period.

1.2.7.6 Matching and reconciliation methodology

The matching exercise involved the comparison of household and person records in census data and PES data. A two-way case-by-case matching was conducted using the two sources: PES questionnaires and census questionnaires. Reconciliation visits were conducted in order to confirm or get more information that would assist in matching unresolved cases, i.e. households or individuals enumerated in the census that did not correspond with households or individuals enumerated in the PES. Guidelines for matching, including rules for determining the match status of households and individuals, were developed. A computer-assisted manual matching system was developed for the capturing of data for matching purposes.

1.2.7.7 PES data collection

PES data collection commenced immediately after the completion of census fieldwork. The PES is a much smaller scale operation (and hence easier to control) than the census. These features enable the PES to deliver a more accurate estimate of the percentage of people and dwellings missed by the census. PES data collection (field operations) was independent from census operations and the following measures were taken to maintain the operational independence of the PES:

- independent listing of enumeration areas (EAs) in the PES sample;
- using separate/independent office staff in the PES and census where possible;
- ensuring the PES interviewers were not employed as census field staff in the same area, and vice versa; and
- maintaining the confidentiality of the PES sample so that census field and office staff were not aware which areas are included in the PES.

Temporary personnel (Fieldworkers and Fieldwork Supervisors) were recruited from the EAs/districts in which they would be working and underwent rigorous training on fieldwork procedures to ensure that they deliver work of high quality at the end of the fieldwork phase. Experienced permanent staff from Household Surveys (based in provincial offices) was seconded to the project for the duration of data collection in supervisory positions to ensure high quality data and minimise costs. The PES followed the integrated approach towards fieldwork; whereby one Fieldworker conducted publicity, listing and enumeration in one EA. A total of 768 Fieldworkers and Fieldwork Supervisors were appointed for the collection of data in the 608 EAs (initially 600, but increased to 608 due to split EAs). A ratio of one Fieldwork Supervisor for four Fieldworkers was applied, but due to the spread of the sample in various districts, this ratio could not always be applied.

1.2.7.8 Matching and reconciliation

The matching process involved the comparison of household and person records in Census data and PES data. The main phases in the matching process were:

- Initial matching involved searching through the census records in order to find the corresponding cases from the PES enumeration records, and vice-versa (a two-way match);
- Capturing involved the capturing of PES and census information on a capturing tool which formed part of the computer-assisted manual matching system. Information for non-matched households and persons was also captured;
- Computer-assisted matching which was the automated assigning of an initial match status for the household and persons, and persons moving status. This process was done concurrently with the capturing process. Classifications from initial matching are as follows:
 1. Matched
 2. Possible match

In PES not in census:

3. In PES not in census – definite non-match
 4. In PES not in census – insufficient or unclear information
 5. In-mover
 6. Born after census
 7. In census not in PES
- Reconciliation visits are follow-up visits to households in the PES sampled EAs. The purpose of reconciliation visits was to collect relevant information in order to determine the final match status of unresolved cases identified during initial matching. Cases of ‘possible match’, ‘in PES not in census – insufficient or unclear information’, and ‘in census not in PES’ were considered unresolved and were sent to the field for reconciliation; and

- Final matching involved the use of the results obtained from the reconciliation visits and initial matching phases to assign a definite match status to each case. The table below illustrates the outcomes from final matching.

<p>1. Matched</p> <p>In PES not in census:</p> <ol style="list-style-type: none"> 2. Missed in census 3. PES erroneous inclusion – cases in PES not in census that were outside the EA boundaries or otherwise erroneously included in PES 4. PES insufficient information – cases in PES not in census for which a final match status cannot be assigned due to insufficient information 5. In-mover 6. Born after Census <p>In census not in PES:</p> <ol style="list-style-type: none"> 7. Correctly enumerated in census, missed in PES 8. Census erroneous inclusion 9. Census insufficient information – cases in census not in PES for which a final match status cannot be assigned due to insufficient information

1.2.7.9 Estimation and tabulation

Coverage measures were calculated only for cases belonging to the PES universe.

The initial estimates – weighted estimates of total from the sample include the following:

- a) Estimated number of non-movers;
- b) Estimated number of out-movers;
- c) Estimated number of matched non-movers;
- d) Estimated number of matched out-movers;
- e) Estimated number of in-movers;
- f) Estimated number of erroneous inclusions in the census; and
- g) Estimated number of correctly enumerated persons missed in the PES

Dual system estimation was used to arrive at the true population of the country. This means that two independent sources or ‘systems’ are used to arrive at the estimate of the true population: the census and the PES. Both estimates contribute to the dual-system estimate, which is more complete than either the census or the PES estimate alone. In the end, this true population is compared with the census-enumerated population and the difference is the net undercount (or overcount). The following table indicates the undercount rates as estimated by the PES.

Table 1.1: Net census coverage error – Total and rate by province

Province	Omission rate for persons	Omission rate for households
Western Cape	18,6	17,8
Eastern Cape	12,9	10,3
Northern Cape	13,4	14,8
Free State	10,1	9,4
KwaZulu-Natal	16,7	16,5
North West	14,9	17,0
Gauteng	14,7	15,2
Mpumalanga	15,5	14,4
Limpopo	10,0	9,6
All provinces	14,6	14,3

The adjustment procedure consisted of creating homogeneous adjustment classes with similar coverage rates and calculating a common undercount rate, adjustment factor and adjustment figure for each class separately. The adjusted figure for the total population was obtained by summing across the adjustment classes. In addition, only the population of households received adjustment classes. The totals for the balance of the population, namely people living in collective quarters and the homeless on the streets, were not adjusted.

1.3 Conclusion

The 2011 Census project had its own challenges and successes, like any other massive project. Be that as it may, the following are worth mentioning: the Census fieldworkers who traversed the country to collect information from households and those that we lost in the process. The respondents who opened their doors and locked their dogs to aid the field staff to do their work, the processors who worked 24hrs/7days a week to ensure that the data can be released within a year of enumeration. The Census management team who met daily for two years to steer the project forward, the Stats SA EXCO for the leadership they provided, the Statistics Council and in particular the sub-committee on population and social statistics for their continued guidance and support and finally the Minister in the Presidency: responsible for planning for the robust interrogation of the plans and guidance on this project. It is through such concerted efforts that as a country we can and will continuously improve on our endeavours.

Chapter 2: Geography of South Africa

2.1 Provincial boundary changes: 2001 to 2011

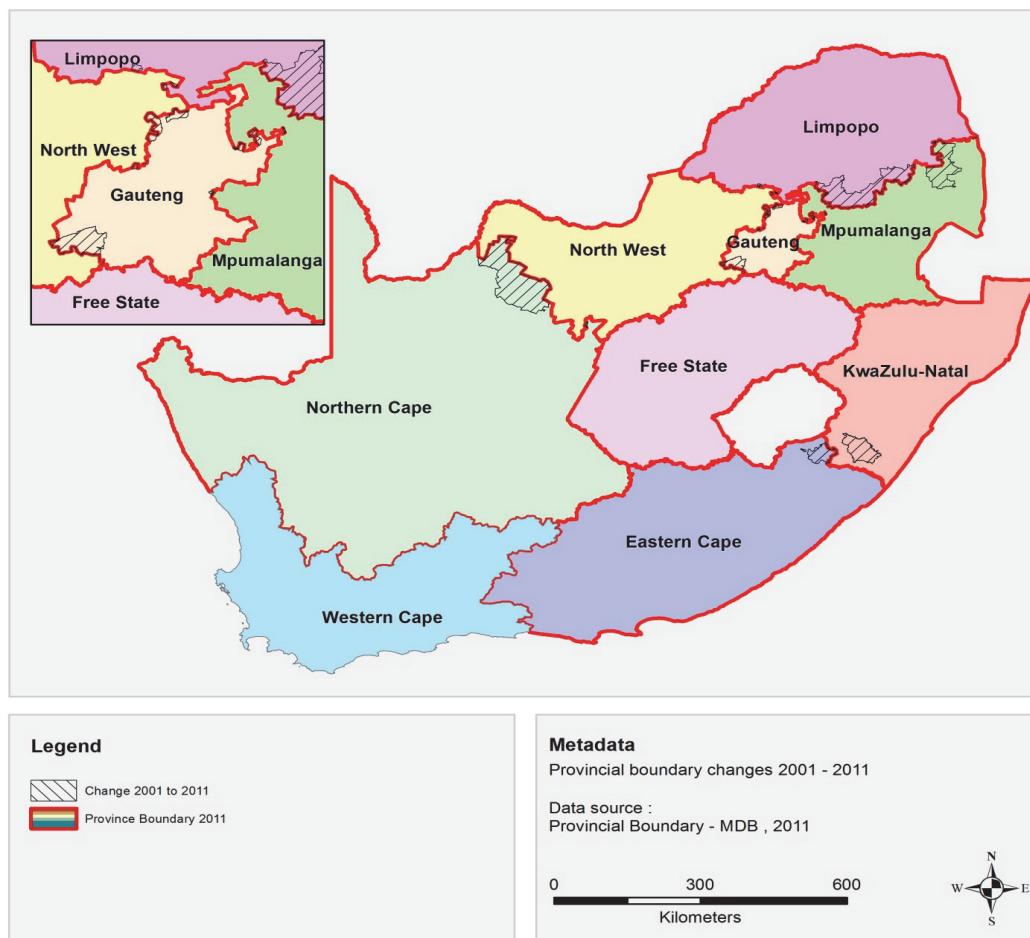

A number of changes occurred in terms of provincial and municipal boundaries during the period between the censuses of 2001 and 2011. Of the nine provinces, only two provinces (Western Cape and Free State) were not affected by changes. The provincial boundary changes were mostly as a result of eight cross-boundary municipalities which were absorbed in full into respective provinces.

Table 2.1: Geographical land area changes since 2001

Province name	Provincial code	Land area in square kilometres 2011	Land area in square kilometres 2001
Western Cape	1	129 462	129 449
Eastern Cape	2	168 966	169 954
Northern Cape	3	372 889	362 599
Free State	4	129 825	129 824
KwaZulu-Natal	5	94 361	92 305
North West	6	104 882	116 231
Gauteng	7	18 178	16 936
Mpumalanga	8	76 495	79 487
Limpopo	9	125 754	122 816
Total		1 220 813	1 219 602

The shift of the national boundary over the Indian Ocean in the North East corner of KwaZulu-Natal to cater for the iSimangaliso Wetland Park led to the increase in South Africa's land area.

Map 2.1: Provincial boundary changes since 2001

Provincial boundary changes mostly affected North West (land size decreased to 11 348,9 square kilometres). Most of this was absorbed by Northern Cape. The second largest decrease in land size was for Mpumalanga which decreased by 2 991,9 square kilometres with Limpopo being the main recipient of this land area.

It should be noted that the increased extent of KwaZulu-Natal is not mainly based on the exchange of Umzimkulu (formerly in the Eastern Cape province) and Matatiele (formerly in KwaZulu-Natal), but due to the shift of the national boundary over the Indian Ocean in the north east corner of the province to cater for the iSimangaliso Wetland Park. In terms of which areas moved to which province, a detailed outline is provided below.

Northern Cape and North West

- GaSegonyana and Phokwane municipalities were cross-boundary municipalities between Northern Cape and North West in 2001 and were allocated to Northern Cape in full based on the current provincial boundaries.
- Kagisano municipality (2001) was split into Kagisano/ Molopo municipality and Joe Morolong municipality, with the former portion now in North West and the latter now part of the Northern Cape province.
- Moshaweng municipality (now part of Joe Morolong municipality) was incorporated in full in Northern Cape based on the current provincial boundaries.

North West and Gauteng

- Merafong City municipality (2001) was a cross-boundary local municipality between North West and Gauteng and was allocated to the Gauteng province based on the current provincial boundaries.
- West Rand (DMA) municipality (2001) was not aligned to the then provincial boundary and was absorbed into Mogale City municipality in full, based on the current provincial boundaries.
- City of Tshwane Metropolitan Municipality was a cross-boundary municipality between Gauteng and North West provinces. The portions adjacent to Moretele and Madibeng municipalities were allocated to Gauteng in full, based on the current provincial boundaries.

North West and Limpopo

- Limpopo lost a portion of the Bela-Bela municipality to North West's Moretele municipality. In turn, North West lost a portion of the Moretele municipality to Limpopo's Bela-Bela municipality, based on the current provincial boundaries.

Gauteng and Mpumalanga

- A portion of Delmas municipality (2001) (now called Victor Khanye) was allocated to the City of Tshwane in Gauteng, based on the current provincial boundaries.
- Kungwini municipality, now incorporated into the City of Tshwane, was a cross-boundary municipality and is now fully allocated to Gauteng, based on the current provincial boundaries.

Mpumalanga and Limpopo

- Greater Groblersdal, (now called Elias Motsoaledi), Greater Marble Hall (now called Ephraim Mogale), and Greater Tubatse were cross-boundary municipalities between Mpumalanga and Limpopo and have now been allocated in full to the Limpopo province. Ephraim Mogale municipality absorbed the Schuinsdraai Nature Reserve.
- Bushbuck Ridge municipality was a cross-boundary municipality between Limpopo and Mpumalanga and has now been allocated in full to the Mpumalanga province. (Bushbuck Ridge also absorbed a portion of the Kruger Park cross-boundary District Management Area.)

KwaZulu-Natal and Eastern Cape

- Umzimkulu, formerly in Eastern Cape, and Matatiele, formerly in KwaZulu-Natal, were in effect exchanged, with Umzimkulu now being in KwaZulu-Natal and Matatiele now being in Eastern Cape, based on the current provincial boundaries.

2.2 Local municipal boundary changes, 2001–2011

In 2001, the geographical frame consisted of 262 local municipalities. This total has been reduced to 234 local municipalities in the 2011 geographical frame. The difference of 28 municipalities is explained as follows:

In total, 25 District Management Areas (DMAs) were absorbed into the existing provinces.

- The City of Tshwane absorbed a further two municipalities (Nokeng Tsa Taemane and Kungwini).
- A new municipality (Kagisano Molopo – NW379) was established by merging NW391 (Kagisano) and NW395 (Molopo).

For municipalities, 107 municipalities decreased in geographical area while 155 municipalities had an increase in geographical area.

Map 2.2: Municipal boundary changes since 2001

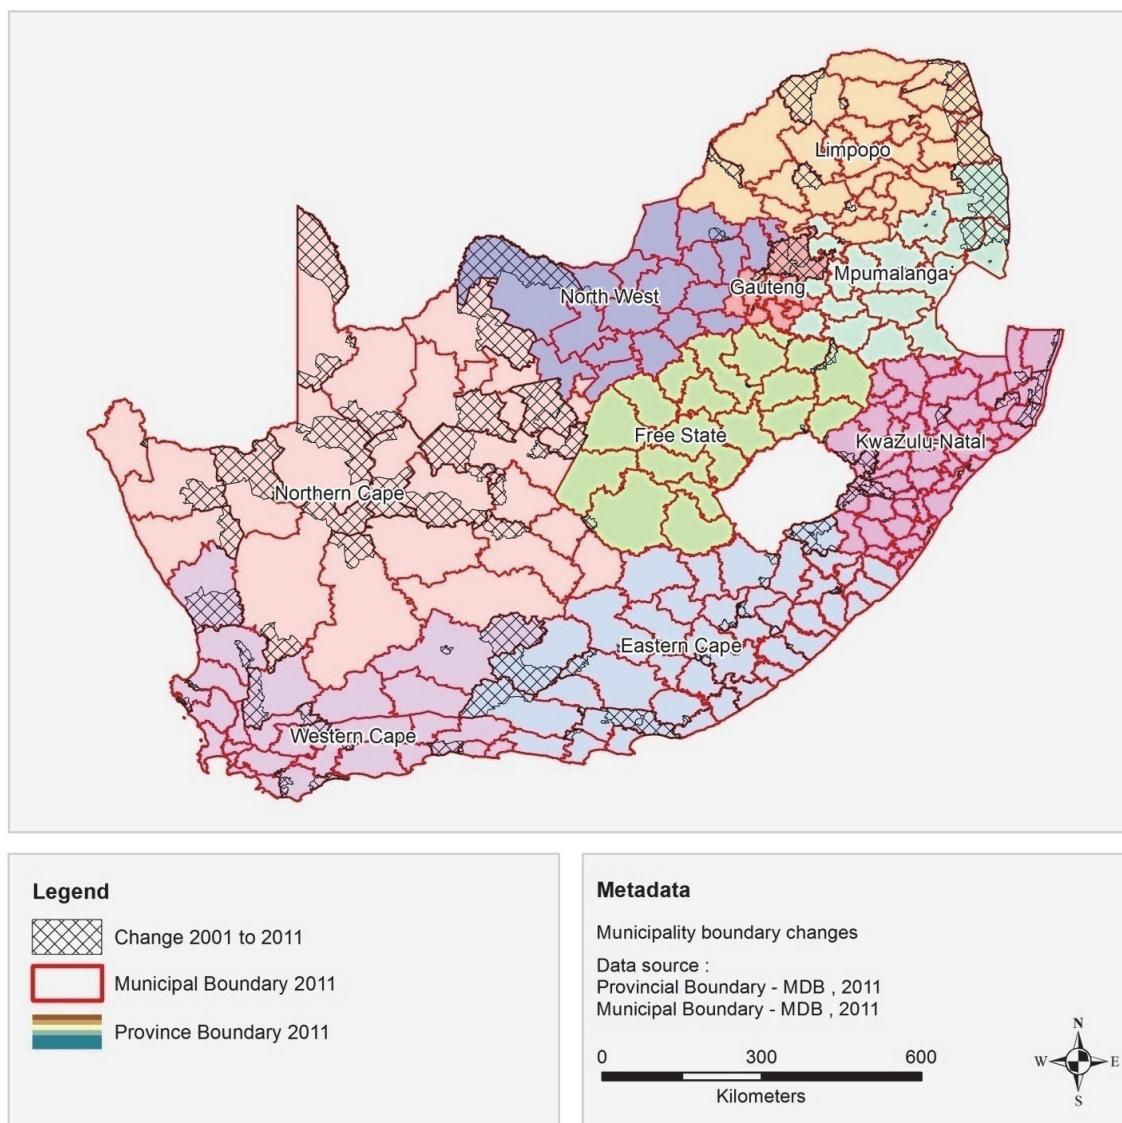

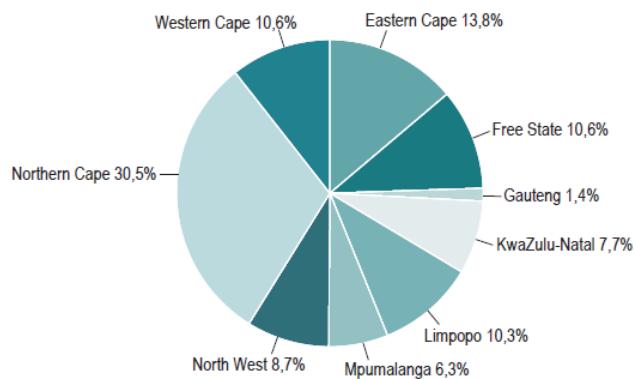

Figure 2.1: Percentage distribution of land area by province, 2011

Source: Stats SA, Geography Division

2.3 Comparing Census 2011 with previous censuses

Comparison of Census 2011 with previous censuses (1996 and 2001) required alignment of data for the two censuses to 2011 municipal boundaries. This is because the country's provincial demarcations underwent changes through a number of changes at provincial and municipal boundaries.

Chapter 3: Results pertaining to persons

3.1 Introduction

A census is the basic source of demographic information at all levels of geography in a given area at a defined time. This chapter provides information on size, composition and structure of the population of Mpumalanga by district and local municipality, and highlights national figures. The chapter also includes data pertaining to migration, general health and functioning, education and employment. Data from the population censuses of 1996, 2001 and 2011 have been used.

3.2 Population size and distribution

Table 3.1: Population of South Africa by province and percentage changes, censuses of 1996, 2001 and 2011

Province	Population			Percentage change	
	Census 1996	Census 2001	Census 2011	1996 & 2001	2001 & 2011
Western Cape	3 956 875	4 524 335	5 822 734	14,3	28,7
Eastern Cape	6 147 244	6 278 651	6 562 053	2,1	4,5
Northern Cape	1 011 864	991 919	1 145 861	-2,0	15,5
Free State	2 633 504	2 706 775	2 745 590	2,8	1,4
KwaZulu-Natal	8 572 302	9 584 129	10 267 300	11,8	7,1
North West	2 727 223	2 984 098	3 509 953	9,4	17,6
Gauteng	7 834 125	9 388 854	12 272 263	19,9	30,7
Mpumalanga	3 123 869	3 365 554	4 039 939	7,7	20,0
Limpopo	4 576 566	4 995 462	5 404 868	9,2	8,2
South Africa	40 583 573	44 819 778	51 770 560	10,4	15,5

The above table shows the population of South Africa from 1996 to 2011 by province. The population of South Africa increased from 44 819 778 in 2001 to 51 770 560 in 2011, yielding a percentage change of 15,5%. The province with the highest population size was Gauteng with 12 272 263, while Northern Cape recorded the lowest with 1 145 861. Mpumalanga recorded a population size of 4 039 939, ranking it sixth as far as population size is concerned.

Table 3.2: Population of South Africa by province and percentage distribution, censuses of 1996, 2001 and 2011

Province	1996		2001		2011	
	N	%	N	%	N	%
Western Cape	3 956 875	9,8	4 524 335	10,1	5 822 734	11,3
Eastern Cape	6 147 244	15,2	6 278 651	14,0	6 562 053	12,7
Northern Cape	1 011 864	2,5	991 919	2,2	1 145 861	2,2
Free State	2 633 504	6,5	2 706 775	6,0	2 745 590	5,3
KwaZulu-Natal	8 572 302	21,1	9 584 129	21,4	10 267 300	19,8
North West	2 727 223	6,7	2 984 098	6,7	3 509 953	6,8
Gauteng	7 834 125	19,3	9 388 854	21,0	12 272 263	23,7
Mpumalanga	3 123 869	7,7	3 365 554	7,5	4 039 939	7,8
Limpopo	4 576 566	11,3	4 995 462	11,2	5 404 868	10,4
South Africa	40 583 573	100,0	44 819 778	100,0	51 770 560	100,0

The above table shows the population distribution of the nine provinces of South Africa from 1996 to 2011. The percentage distribution shows that the highest increase was recorded in Gauteng, and the highest decrease was recorded in KwaZulu-Natal from 2001 to 2011. In 2011, Gauteng recorded the highest proportion of the population (23,7%), while Northern Cape recorded the lowest with 2,2%. Mpumalanga recorded a population of 7,8%.

Table 3.3: Percentage distribution of the South African population by population group and province, censuses of 1996, 2001 and 2011

Province	Black African		Coloured		Indian or Asian		White	
	1996	2001	1996	2001	1996	2001	1996	2001
Western Cape	21,6	26,7	33,4	56,0	53,9	49,6	1,1	1,1
Eastern Cape	86,6	87,2	86,5	7,7	7,7	8,3	0,3	0,4
Northern Cape	44,9	46,5	51,2	43,7	42,9	41,0	0,2	0,7
Free State	84,8	88,0	87,8	3,0	3,1	3,1	0,1	0,4
Kwazulu-Natal	82,8	85,2	87,0	1,4	1,5	1,4	9,3	8,3
North West	90,1	90,0	90,1	1,6	1,8	2,0	0,4	0,3
Gauteng	72,3	75,2	77,9	3,6	3,6	3,5	2,1	2,3
Mpumalanga	91,0	93,2	90,9	0,7	0,7	0,9	0,4	0,7
Limpopo	96,9	97,0	96,8	0,2	0,2	0,3	0,1	0,2
South Africa	77,4	79,0	79,6	9,0	8,9	9,0	2,6	2,5
							2,5	11,0
							9,6	8,9

This table excludes other and unspecified population groups

Table 3.3 shows the percentage distribution of the South African population by population group and province from 1996 to 2011. The black African population has increased, whilst the white population has decreased. The coloured population remained almost the same from 2001 to 2011. The proportion of black Africans has also increased in all provinces except for North West province. The proportion of coloured people has increased in most provinces, except for Western Cape, Northern Cape, KwaZulu-Natal and Gauteng. The proportion of Indians remained more or less the same in most provinces, except in KwaZulu-Natal, which recorded a decrease from 9,3% in 1996 to 7,4% in 2011. The proportion of the white population has decreased in all the provinces, except in Mpumalanga where it has increased from 5,9% in 2001 to 7,5% in 2011.

Table 3.4: Population size and percentage changes by district and local municipality, censuses of 1996, 2001 and 2011

Municipality	Population			Percentage change	
	Census 1996	Census 2001	Census 2011	1996 & 2001	2001 & 2011
Gert Sibande	797 400	900 007	1 043 194	12,9	15,9
Albert Luthuli	182 719	187 751	186 010	2,8	-0,9
Msukaligwa	105 368	124 812	149 377	18,5	19,7
Mkhondo	100 388	143 077	171 982	42,5	20,2
Pixley Ka Seme	70 178	80 737	83 235	15,0	3,1
Lekwa	90 080	103 265	115 662	14,6	12,0
Dipaleseng	39 042	38 618	42 390	-1,1	9,8
Govan Mbeki	209 626	221 747	294 538	5,8	32,8
Nkangala	962 249	1 018 422	1 308 129	5,8	28,4
Victor Khanye	53 208	56 335	75 452	5,9	33,9
Emalahleni	236 040	276 413	395 466	17,1	43,1
Steve Tshwete	135 335	142 772	229 831	5,5	61,0
Emakhazeni	37 004	43 007	47 216	16,2	9,8
Thembisile	241 360	256 583	310 458	6,3	21,0
Dr JS Moroka	259 302	243 313	249 705	-6,2	2,6
Ehlanzeni	1 364 221	1 447 125	1 688 615	6,1	16,7
Thaba Chweu	65 909	81 681	98 387	23,9	20,5
Mbombela	426 090	476 904	588 794	11,9	23,5
Umjindi	48 547	53 744	69 577	10,7	29,5
Nkomazi	277 864	334 669	390 610	20,4	16,7
Bushbuckridge	545 811	500 128	541 248	-8,4	8,2
Mpumalanga	3 123 869	3 365 554	4 039 939	7,7	20,0

Table 3.4 gives the population of Mpumalanga from 1996 to 2011 by district and local municipality within the district. The population of Mpumalanga increased from 3 365 554 in 2001 to 4 039 939 in 2011, yielding a percentage change of 20%. In 2011, the district municipality with the highest population size was Ehlanzeni (1 688 615), while Gert Sibande recorded the lowest population (1 043 194). Mbombela local municipality had the highest population (588 000), and Dipaleseng the lowest (42 390). Steve Tshwete had the highest percentage change of 61%, followed by Emalahleni at 43,1%

Table 3.5: Population size and percentage distribution by district and local municipality, censuses of 1996, 2001 and 2011

Municipality	Census 1996		Census 2001		Census 2011	
	N	%	N	%	N	%
Gert Sibande	797 400	25,5	900 007	26,7	1 043 194	25,8
Albert Luthuli	182 719	5,8	187 751	5,6	186 010	4,6
Msukaligwa	105 368	3,4	124 812	3,7	149 377	3,7
Mkhondo	100 388	3,2	143 077	4,3	171 982	4,3
Pixley Ka Seme	70 178	2,2	80 737	2,4	83 235	2,1
Lekwa	90 080	2,9	103 265	3,1	115 662	2,9
Dipaleseng	39 042	1,2	38 618	1,2	42 390	1,1
Govan Mbeki	209 626	6,7	221 747	6,6	294 538	7,3
Nkangala	962 249	30,8	1 018 422	30,3	1 308 129	32,4
Victor Khanye	53 208	1,7	56 335	1,7	75 452	1,9
Emalahleni	236 040	7,6	276 413	8,2	395 466	9,8
Steve Tshwete	135 335	4,3	142 772	4,2	229 831	5,7
Emakhazeni	37 004	1,2	43 007	1,3	47 216	1,2
Thembisile	241 360	7,7	256 583	7,6	310 458	7,7
Dr JS Moroka	259 302	8,3	243 313	7,2	249 705	6,2
Ehlanzeni	1 364 221	43,7	1 447 125	43,0	1 688 615	41,8
Thaba Chweu	65 909	2,1	81 681	2,4	98 387	2,4
Mbombela	426 090	13,6	476 904	14,2	588 794	14,6
Umjindi	48 547	1,6	53 744	1,6	69 577	1,7
Nkomazi	277 864	8,9	334 669	9,9	390 610	9,7
Bushbuckridge	545 811	17,5	500 128	14,9	541 248	13,4
Mpumalanga	3 123 869	100,0	3 365 554	100,0	4 039 939	100,0

The above table shows that, compared to 1996, the percentage share of the population decreased in Ehlanzeni and Gert Sibande in 2011, but shows growth in Nkangala. Despite the decrease in the percentage share, Ehlanzeni district recorded 41,8%, which was still the highest population percentage share of all the districts, while Gert Sibande recorded 25,8%, which was the lowest. Mbombela local municipality recorded the highest percentage share of 14,6%, whereas Dipaleseng local municipality recorded the lowest share (1,1%).

Table 3.6: Percentage distribution of the population groups by population group by district and local municipality, censuses of 1996, 2001 and 2011

Municipality	Black African			Coloured			Indian or Asian			White		
	1996	2001	2011	1996	2001	2011	1996	2001	2011	1996	2001	2011

Steve Tshwete	67,9	80,1	73,8	2,6	2,5	2,6	1,4	0,9	1,6	28,1	16,5	21,9
Emakhazeni	88,2	89,1	87,4	0,5	1,1	1,2	0,5	0,2	0,7	10,9	9,6	10,8
Thembisile	99,8	99,8	99,4	0,1	0,1	0,2	0,0	0,0	0,3	0,1	0,1	0,1
Dr JS Moroka	99,9	99,9	99,6	0,1	0,1	0,1	0,0	0,0	0,3	0,0	0,1	0,1
Ehlanzeni	95,6	96,1	94,2	0,5	0,5	0,7	0,2	0,2	0,4	3,7	3,2	4,7
Thaba Chweu	83,8	86,1	82,1	2,1	2,0	2,7	0,5	0,4	0,6	13,6	11,6	14,6
Mbombela	91,1	93,1	89,6	0,7	0,8	1,0	0,4	0,3	0,7	7,8	5,8	8,8
Umjindi	87,5	88,7	87,2	1,5	1,6	2,0	1,2	1,0	1,0	9,8	8,8	9,8
Nkomazi	98,7	98,6	97,8	0,2	0,2	0,1	0,1	0,3	1,1	1,2	1,6	
Bushbuckridge	99,7	99,6	99,1	0,2	0,1	0,1	0,0	0,0	0,1	0,2	0,2	
Mpumalanga	91,0	93,2	90,9	0,7	0,7	0,9	0,4	0,3	0,7	7,9	5,9	7,5

The above table shows that, compared with 2001, the proportion of the black African population has decreased in most of the districts and local municipalities, while the proportion of the coloured population has slightly increased in all districts and in most of the local municipalities, except in Albert Luthuli, Dr JS Moroka, Nkomazi and Bushbuckridge local municipalities. The proportion of the Indian population has increased in all the districts and in 17 local municipalities, except in Umjindi local municipality. The proportion of the white population has also increased in all the districts and in 14 local municipalities, except in Emalahleni, Thembisile, Dr JS Moroka and Bushbuckridge local municipalities.

3.3 Population structure: Age and sex

Figure 3.1: Population structure by age and sex – South Africa, 2011

Figure 3.1: South Africa: 2011

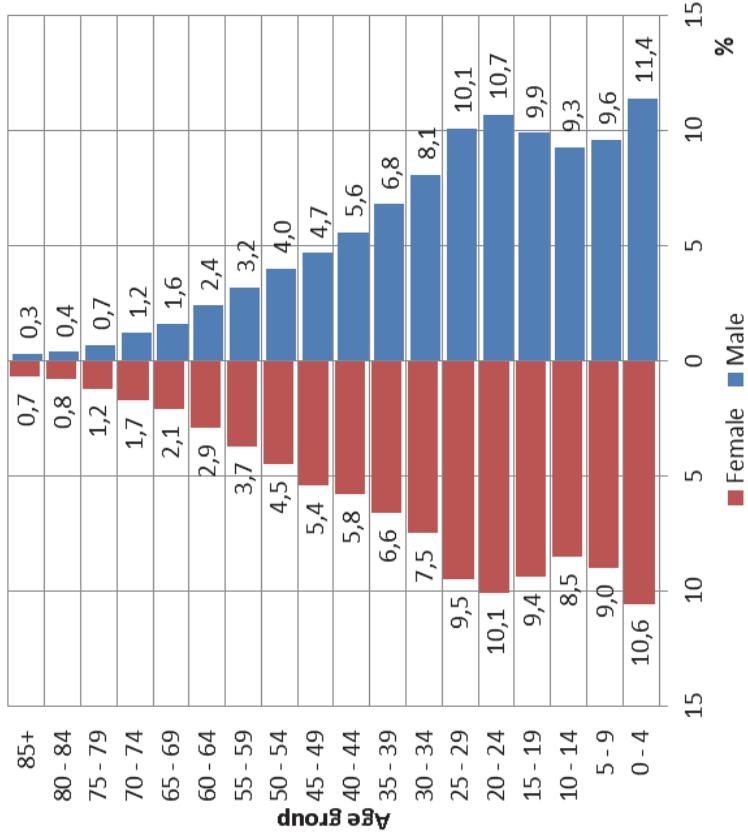

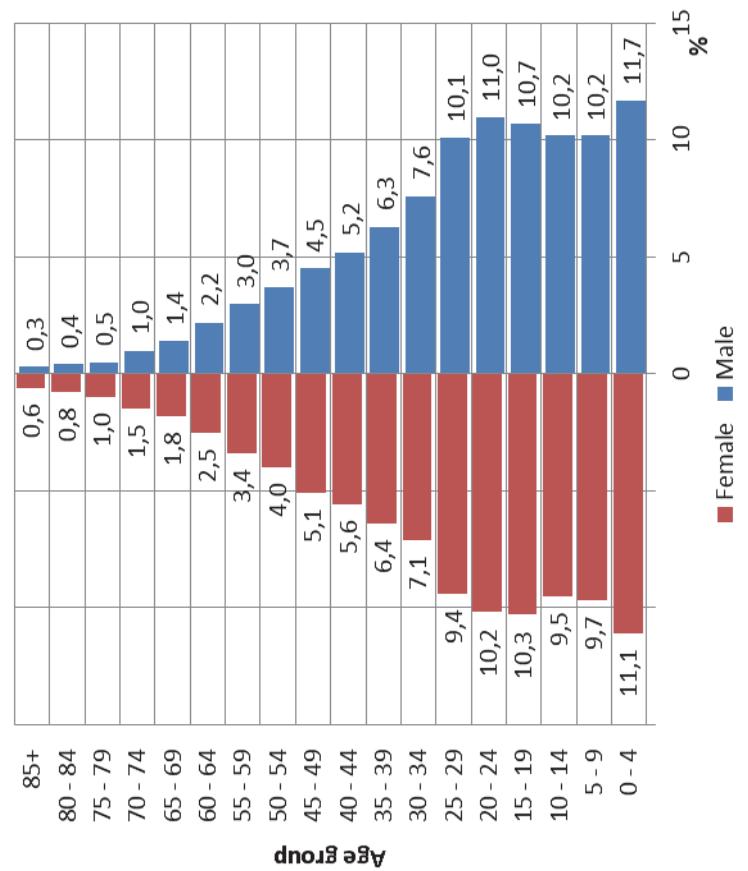

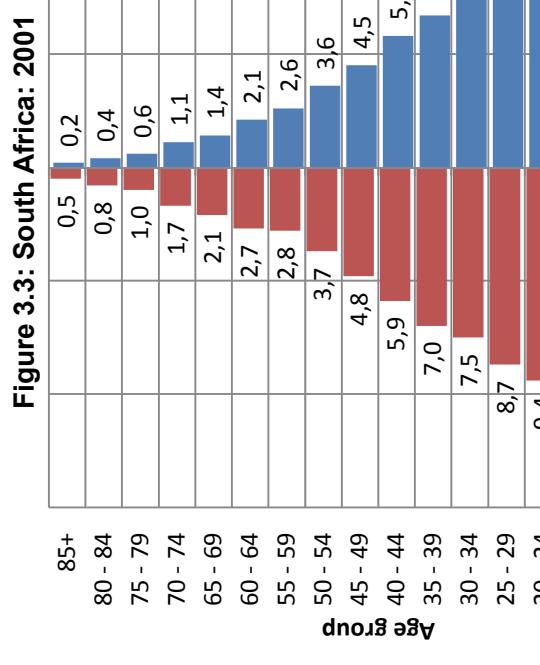

Figure 3.2: Population structure by age and sex – Mpumalanga, 2011

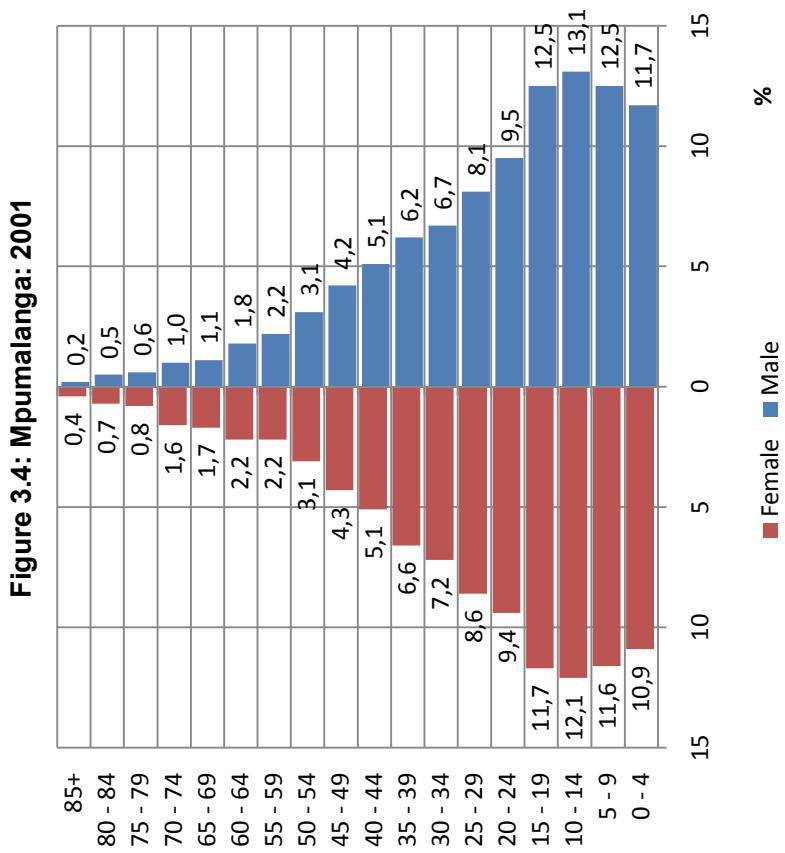

Figure 3.2: Mpumalanga: 2011

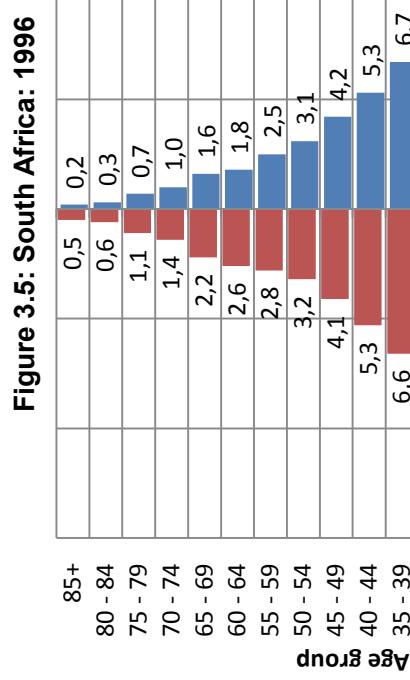

**Figure 3.3: Population structure by age and sex –
South Africa, 2001**

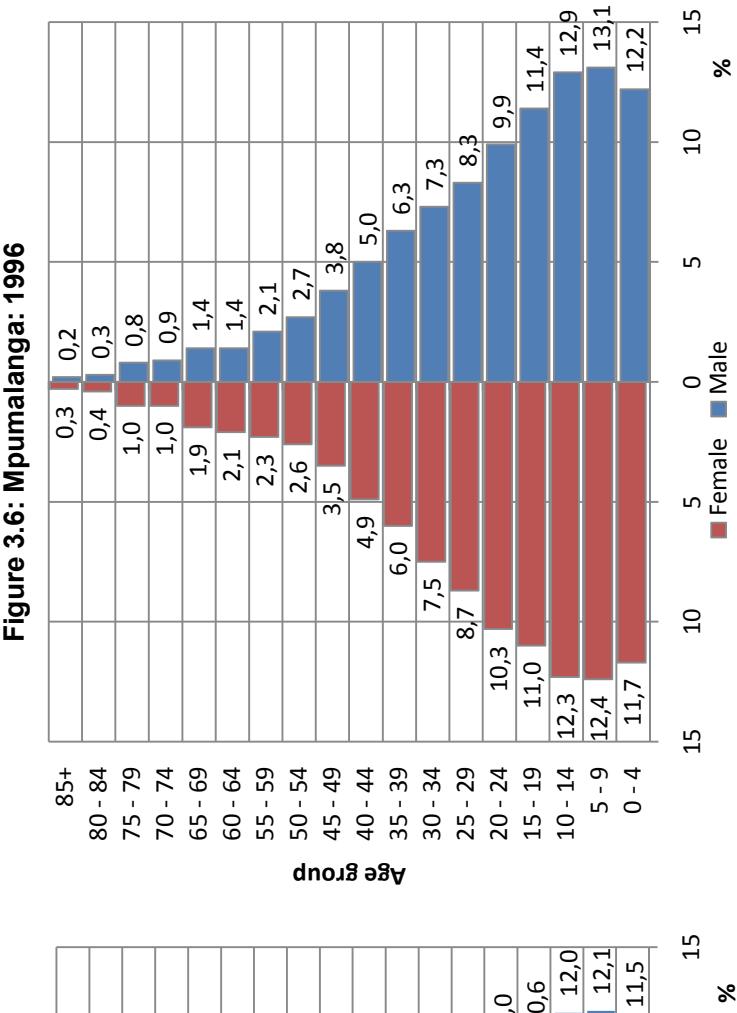

**Figure 3.4: Population structure by age and sex –
Mpumalanga, 2001**

**Figure 3.5: Population structure by age and sex –
South Africa, 1996**

**Figure 3.6: Population structure by age and sex –
Mpumalanga, 1996**

The above figures depict the percentage distribution the population by age and sex in Mpumalanga and South Africa in 1996, 2001 and 2011. Both nationally and provincially, the figures show that the proportion of males in the younger age groups was larger than that of the females, whilst in the older age groups the female proportions were higher than those of the males. The population in 1996 and 2001 began to increase from the 5-9 age groups and decreased as age increases. However, in 2011, both nationally and provincially, there was a marked decrease of males and females aged 5-9 and 10-14.

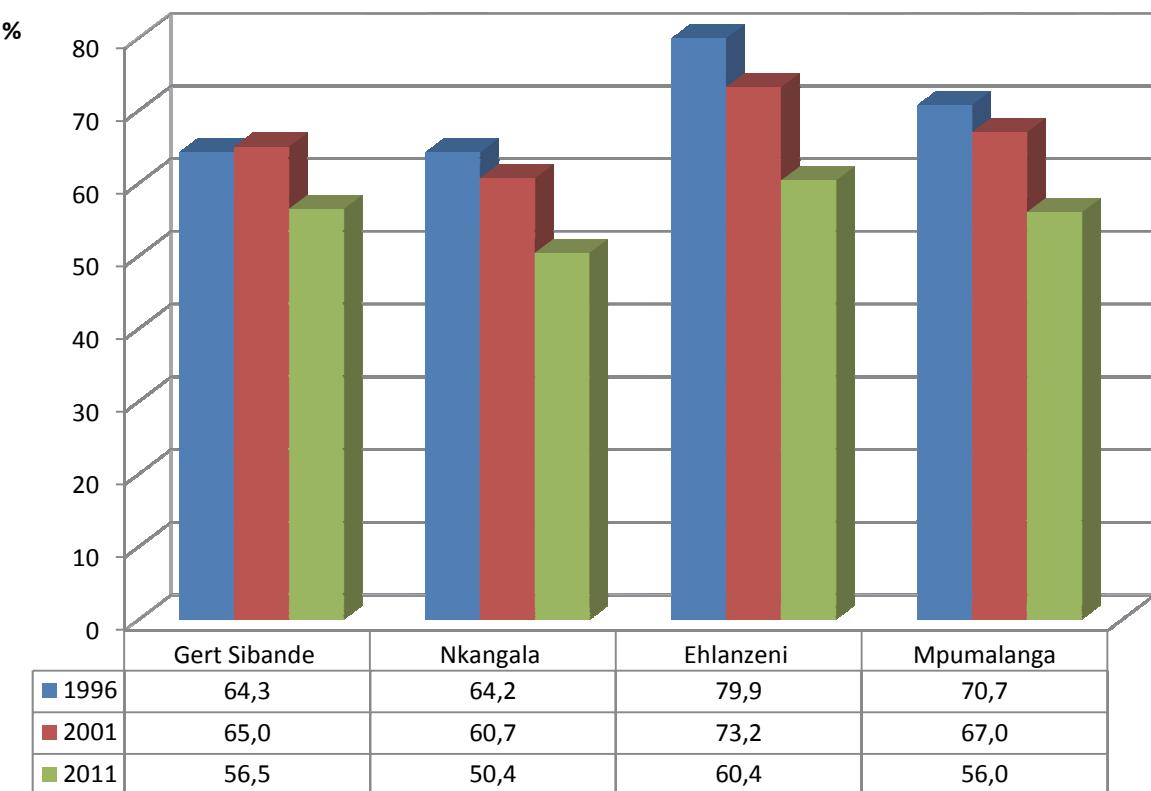

Figure 3.7: Dependency ratios by district municipality, censuses of 1996, 2001 and 2011

Figure 3.7 shows the dependency ratios for Mpumalanga from 1996 to 2011 by district municipality. It can be observed that the dependency ratio in Mpumalanga has decreased from 70,7 in 1996 to 56 in 2011. The figures for all three districts show the same trend. However, the dependency ratio in Ehlanzeni has remained higher than the provincial average for all three censuses, while Gert Sibande in 2011 recorded higher than the provincial average.

3.4 Language

Table 3.7: Population by language spoken, district, and local municipality, Census 2011

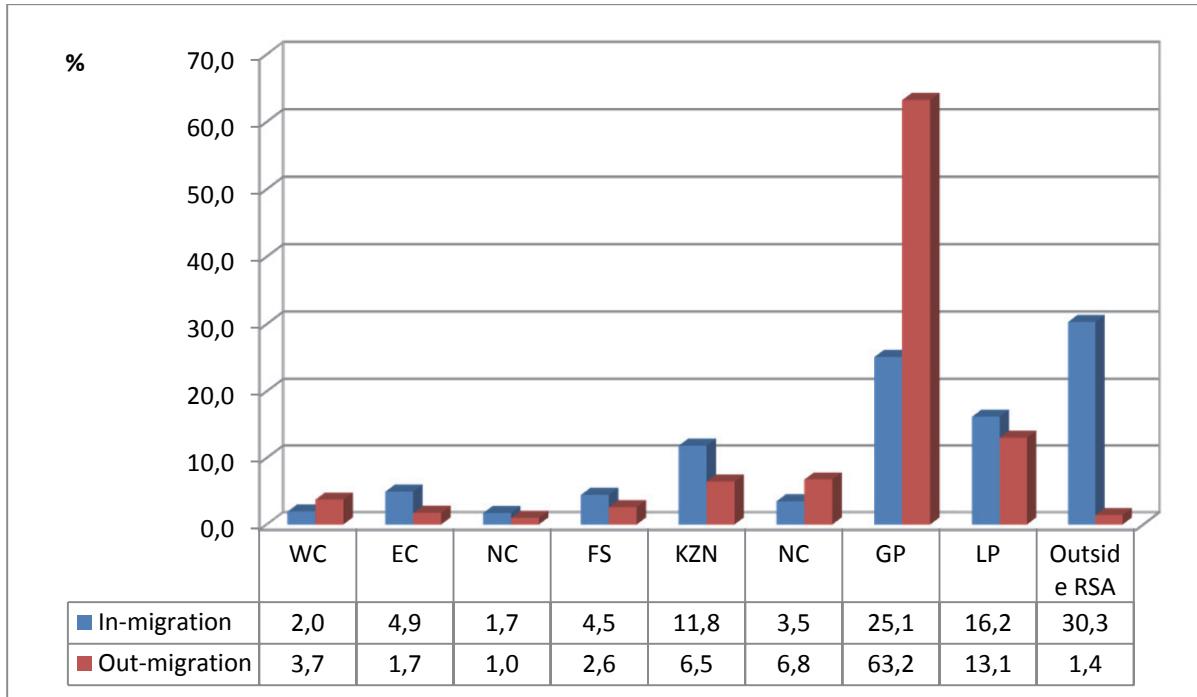

Municipality	Afrikaans	English	IsiNdebele	IsiXhosa	IsiZulu	Sepedi	Sesotho	Setswana	Sign language	Siswati	Tshivenda	Xitsongwa	Other
Gert Sibande	9,1	3,4	3,1	2,1	60,9	1,0	4,2	0,8	0,3	13,0	0,2	1,0	0,9
Albert Luthuli	1,6	2,0	1,4	0,2	34,8	0,4	0,4	0,3	0,2	57,0	0,2	0,6	0,7
Msukaligwa	9,8	3,5	1,4	0,6	72,6	0,6	0,7	0,8	0,3	8,5	0,2	0,5	0,7
Mkhondo	3,5	2,4	1,0	0,1	89,1	0,2	0,2	0,6	0,3	1,8	0,1	0,1	0,6
Pixley Ka Seme	6,8	2,3	1,0	0,4	82,8	0,4	2,2	0,7	0,4	2,0	0,1	0,2	0,7
Lekwa	13,2	3,6	1,2	1,5	66,2	0,6	10,3	0,8	0,3	1,1	0,2	0,4	0,7
Dipaleseng	9,0	3,0	1,1	2,4	56,1	1,0	24,2	1,0	0,5	0,5	0,2	0,4	0,6
Govan Mbeki	15,9	5,1	7,7	5,8	47,4	2,4	6,0	1,2	0,4	3,6	0,5	2,7	1,4
Nkangala	10,0	3,6	28,4	1,9	23,2	14,7	3,8	4,6	0,3	4,7	0,4	3,2	1,3
Victor Khanye	15,9	3,6	25,4	3,3	36,0	3,4	3,9	2,1	0,2	1,9	0,6	1,9	1,9
Emalahleni	15,2	5,7	9,0	3,2	39,2	11,4	3,2	1,3	0,3	5,9	0,5	3,5	1,7
Steve Tshwete	22,6	5,9	14,9	2,3	28,3	10,8	4,0	1,6	0,3	5,3	0,4	2,0	1,6
Emakhazeni	10,7	4,4	18,8	0,6	21,8	6,7	4,0	0,9	0,5	28,4	0,3	2,1	1,1
Thembisile	0,4	1,2	58,5	1,0	12,5	12,6	4,8	1,9	0,3	2,9	0,4	2,6	0,9
Dr JS Moroka	0,3	1,3	36,2	0,5	3,1	30,8	3,4	17,3	0,3	0,8	0,4	5,0	0,7
Ehlanzeni	4,0	2,6	0,3	0,2	2,2	10,3	2,7	0,3	0,1	54,5	0,2	21,8	0,8
Thaba Chweu	15,2	4,3	2,4	0,6	7,7	36,2	7,3	0,9	0,3	17,8	0,4	5,5	1,6
Mbombela	6,8	4,7	0,2	0,2	1,5	0,7	1,5	0,3	0,1	78,7	0,3	4,1	1,1
Umjindi	9,0	5,7	0,1	0,3	1,5	0,5	0,8	0,3	0,1	77,0	0,4	3,2	1,1
Nkomazi	1,4	1,1	0,1	0,1	0,6	0,1	0,1	0,1	0,1	88,5	0,2	6,8	0,9
Bushbuckridge	0,2	0,7	0,1	0,1	3,3	24,5	5,4	0,3	0,1	7,8	0,2	56,9	0,4
Mpumalanga	7,2	3,1	10,1	1,2	24,1	9,3	3,5	1,8	0,2	27,7	0,3	10,4	10

*Note: This table excludes cases where the language was unspecified

Table 3.7 gives the percentage distribution of the population of Mpumalanga in 2011 by district and local municipality within the districts by the language most spoken by respondents. SiSwati (27,7%) was the most spoken language in Mpumalanga, followed by IsiZulu (24,1%), whilst Sign language was the least spoken language with only 0,2%. SiSwati was the most spoken language in Ehlanzeni district (54,5%), while IsiZulu was the most spoken language in Gert Sibande district (60,9%), and IsiNdebele was the most spoken language in Nkangala district (28,4%).

3.5 Migration

Figure 3.8: Inter-provincial migration, between Census 2001 and Census 2011

The above figure shows the migration patterns of the population of Mpumalanga province. More than 63% of Mpumalanga emigrants went to Gauteng province, whilst only 2% went to Western Cape, which recorded the lowest proportion.

More than 30% of Mpumalanga immigrants came from other countries, which recorded the highest proportion, since Mpumalanga share borders with Mozambique and Swaziland and more than a quarter of Mpumalanga immigrants came from Gauteng province, which recorded the second highest proportion, whilst only 1% went to Eastern Cape, which was the lowest and only 1,4% went to other countries.

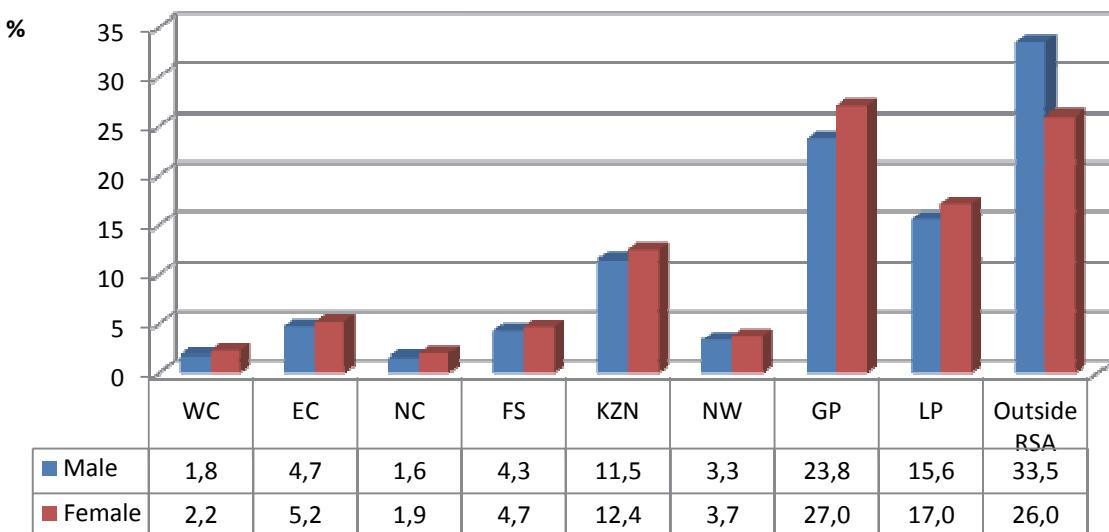

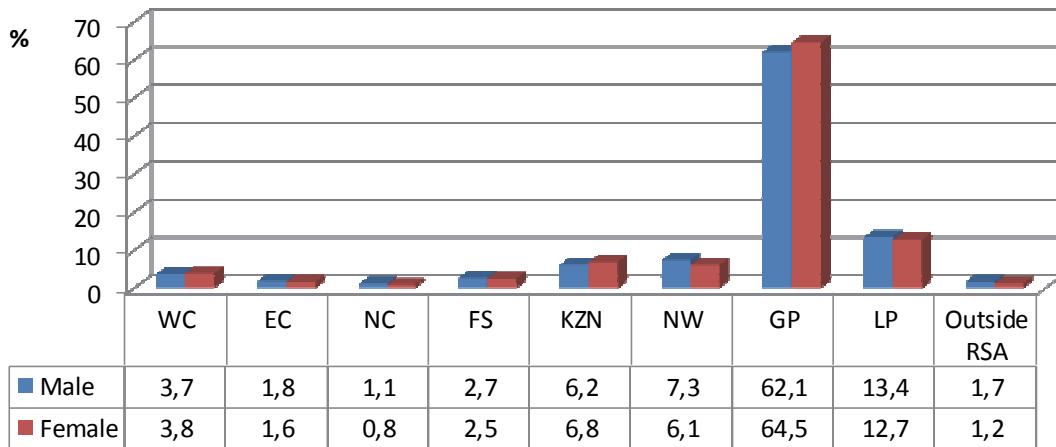

Figure 3.9: Provincial in-migration by sex, between Census 2001 and Census 2011

Figure 3.9 shows the in-migration patterns by sex of the population of Mpumalanga province. A high percentage of Mpumalanga immigrants, both male and female, came from outside South Africa (33,5% and 26% respectively). The second highest percentage of immigrants came from Gauteng (23,8% males and 27% females). It is observed that, from the other eight provinces of South Africa, more females than males migrated to Mpumalanga.

Figure 3.10: Provincial out-migration by sex, between Census 2001 and Census 2011

The above figure shows the out-migration patterns by sex of the population of Mpumalanga province. A high percentage of Mpumalanga emigrants (both male and female) migrated to Gauteng (62,1% and 64,5% respectively), followed by Limpopo (13,4% and 12,7% respectively).

3.6 General health and functioning

3.6.1 Introduction

Note that the question on disability had changed, and therefore Census 2011 data are not comparable with previous censuses. Initial analysis of Census 2011 results clearly showed that this set of questions was not suitable for measuring disability among children aged five years or younger. A large number of children were categorised as 'cannot see, hear, walk, communicate at all', not because they were inherently disabled but because of their level of development. Therefore, the data on children younger than five years was excluded in Census 2011.

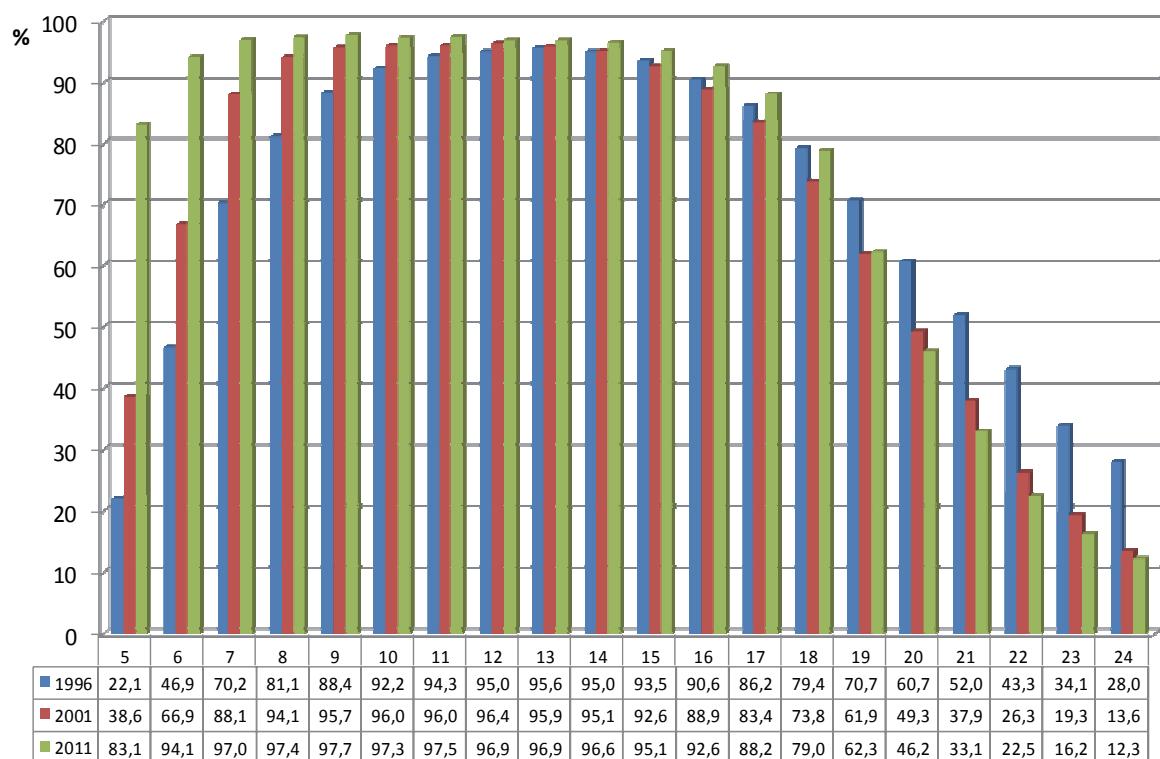

Table 3.8: Distribution of population aged 5 years and older by disability status and sex, Census 2011

Province and district	Disability status	Male	Female	Total	Male	Female	Total
		N	N	N	%	%	%
Gert Sibande	Not disabled	325 499	335 139	660 638	92,4	89,8	91,1
	Disabled	26 710	37 871	64 581	7,6	10,2	8,9
	Total	352 209	373 010	725 219	100,0	100,0	100,0
Nkangala	Not disabled	443 056	442 244	885 300	93,9	91,9	92,9
	Disabled	28 774	38 887	67 661	6,1	8,1	7,1
	Total	471 830	481 131	952 961	100,0	100,0	100,0
Ehlanzeni	Not disabled	552 848	628 733	1 181 581	94,6	93,8	94,2
	Disabled	31 308	41 730	73 038	5,4	6,2	5,8
	Total	584 156	670 463	1 254 619	100,0	100,0	100,0
Mpumalanga	Not disabled	1 321 403	1 406 116	2 727 519	93,8	92,2	93,0
	Disabled	86 792	118 488	205 280	6,2	7,8	7,0
	Total	1 408 195	1 524 604	2 932 799	100,0	100,0	100,0

Table 3.8 gives the disability status of persons aged 5 years and older in Mpumalanga province by sex. The profile indicates that 7% of the population were disabled. Gert Sibande recorded the highest proportion (8,9%), while Ehlanzeni recorded the lowest proportion (5,8%) of disabled persons. The comparison among males and females across the province shows that females were more affected than males (6,2% of males as compared to 7,8% of females). This same trend is also observed amongst the districts in the province.

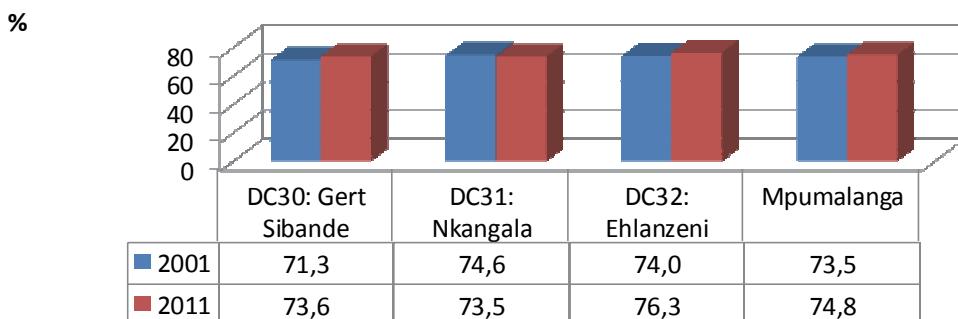

3.7 Education

Figure 3.11: Percentage of persons aged 5–24 years attending an educational institution, censuses of 1996, 2001 and 2011

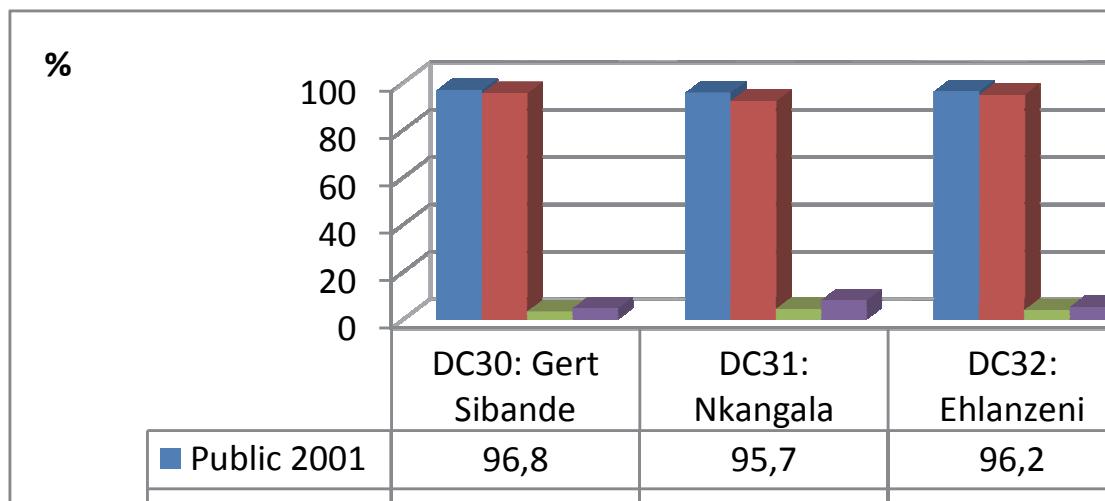

The above figure shows comparisons between the censuses of 1996, 2001 and 2011 of school attendance in Mpumalanga. Up to age 12 there was a general increase in the percentage of persons attending an educational institution between 1996 and 2011. However, Census 2011 data show slight fluctuations. Significant progress can be seen amongst the age group 5–9 years in terms of increased enrolment rates between 1996 and 2011. Although school attendance declined for the cohort 12 to 24 years, Census 1996 proportions were significantly higher than 2001 and 2011 data points. Focusing on the compulsory age of 9 years that a child must be attending school, the proportion attending school has increased from just above 88% in 1996 to about 96% in 2001, and then again to about 98% in 2011.

Figure 3.12: Percentage of persons aged 5–24 years attending an educational institution by district municipality, Census 2001 and Census 2011

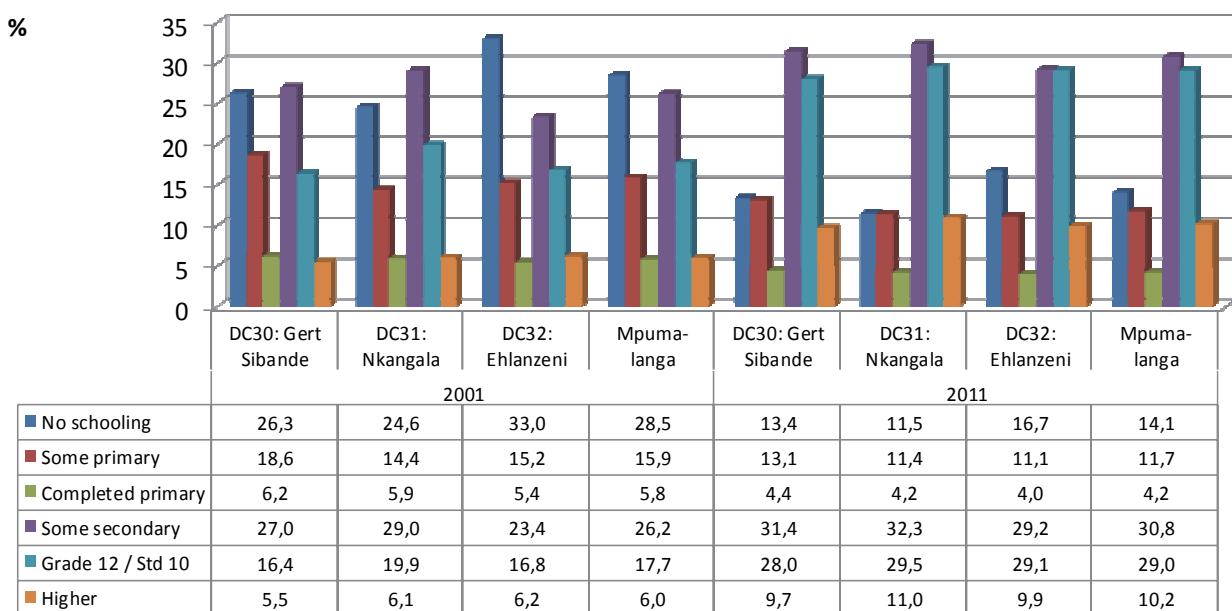

The above figure shows school attendance in Mpumalanga by district, amongst persons aged 5–24 years, with comparisons between 2001 and 2011. It can be observed that the proportion of learners attending school has increased in two districts in Mpumalanga, with a decrease recorded in Nkangala. In 2011, Ehlanzeni recorded a percentage of 76,3% persons who were attending an educational institution, which was slightly higher than the percentages for the other two districts.

Figure 3.13: Percentage of persons aged 5–24 years attending an educational institution by type of institution and by district municipality, Census 2001 and Census 2011

The above figure shows school attendance by type of institution in Mpumalanga by district, amongst persons aged 5–24 years, by comparing data from Census 2001 and Census 2011. It can be observed that the proportion of persons attending public schools has slightly decreased, while the proportion of those attending private schools has increased in all districts. A significant percentage shift was observed in Nkangala district. In 2011, Mpumalanga recorded a 94,2% attendance at public schools and 5,8% attendance at private institutions.

Figure 3.14: Highest educational attainment amongst persons aged 20 years and older by district municipality, Census 2001 and Census 2011

It can be observed from the above figure that in Mpumalanga and all its districts, the proportion of persons with either no schooling or some primary education has significantly decreased, whilst the proportion of persons with Grade 12 or a higher education has increased between the two censuses.

In 2011, Mpumalanga recorded a proportion of only 10,2% of persons with a tertiary qualification, while 14,1% of its population was recorded as having no education. Nkangala district recorded the highest proportion of persons with a tertiary education with 11,0%, while Ehlanzeni recorded the highest proportion of persons with no schooling (16,7%).

Figure 3.15: Highest educational attainment amongst persons aged 20 years and older by sex, Census 2001 and Census 2011

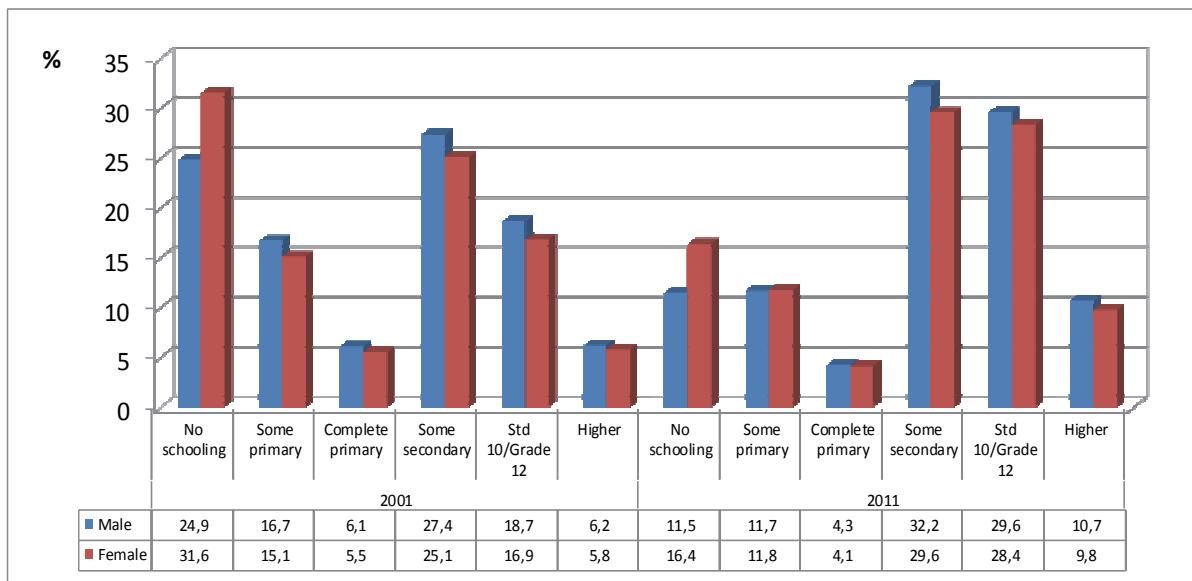

Figure 3.15 shows that, for Mpumalanga and all its districts, the proportion of persons with either no schooling or some primary education has significantly decreased for both males and females, whilst the proportion of persons with Grade 12 or a higher education has increased for both males and females, between the two censuses.

In 2011, Mpumalanga recorded a proportion of 10,7% of males and only 9,8% of females with a tertiary qualification, while the percentage of females with no schooling (16,4%) remained higher than that of males (11,5%).

Figure 3.16: Highest educational attainment amongst persons aged 20 years and older by population group, Census 2001 and Census 2011

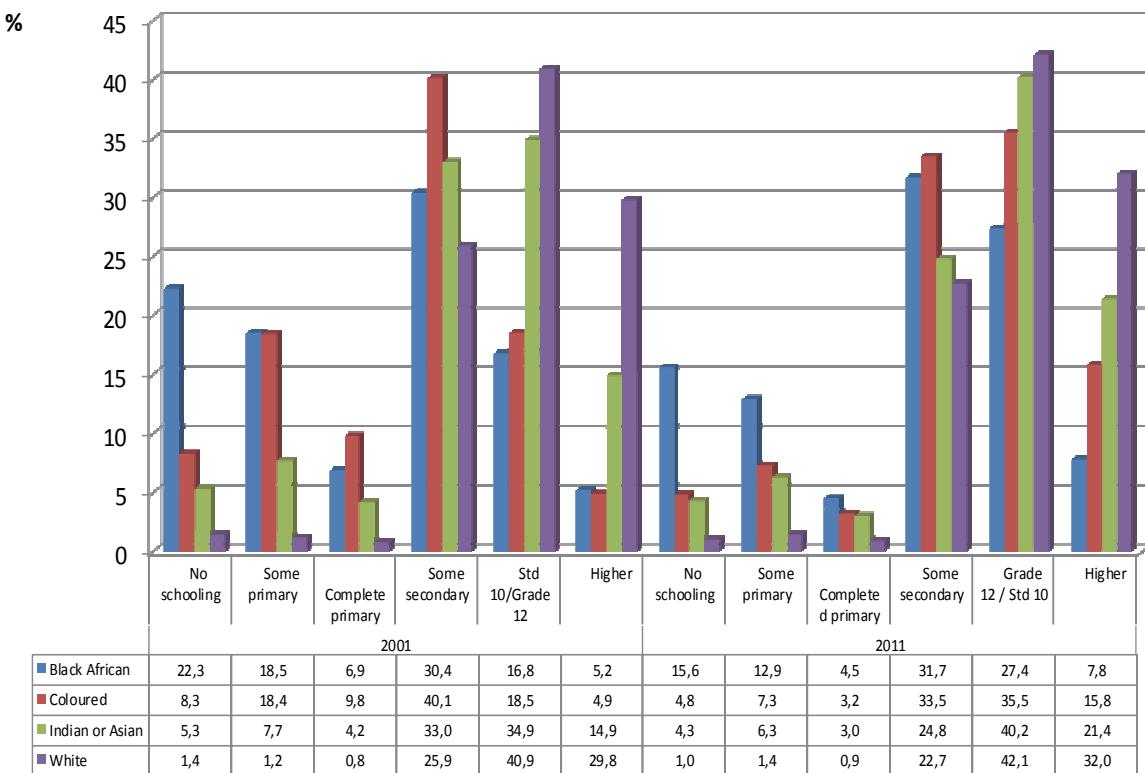

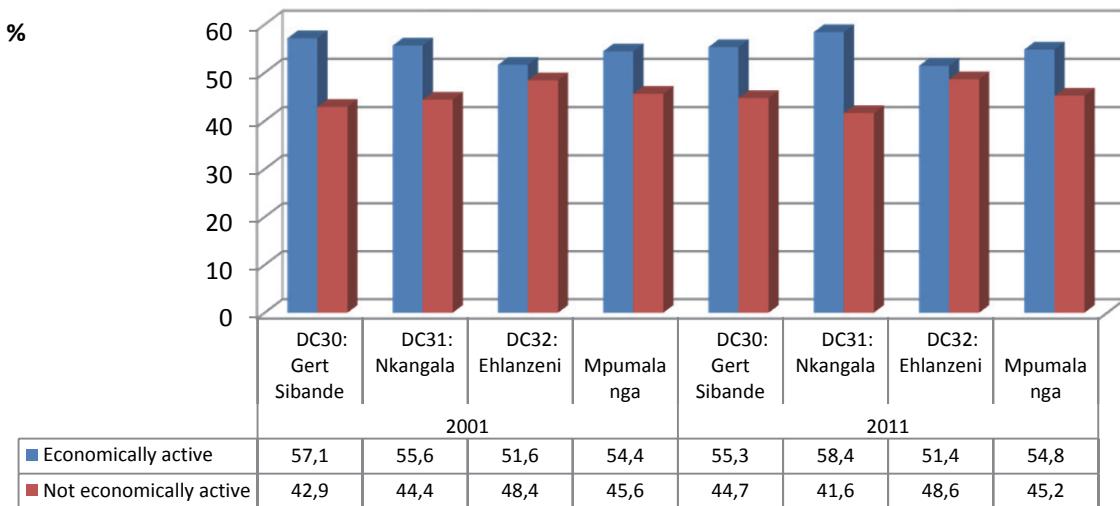

Figure 3.16 shows that the proportion of persons with either no schooling or some primary education has decreased for all population groups, except for the white population group, whilst the proportion of persons with Grade 12 or a higher education has increased for all the population groups between Census 2001 and Census 2011. Despite the changes, the proportion of black Africans with no schooling remains significantly higher than that of the other population groups.

In 2011, 32% of the white population in Mpumalanga had a higher education, followed by the Indian/Asian population at 21,4%, the coloured population at 15,8%, and the black African population at only 7,8%.

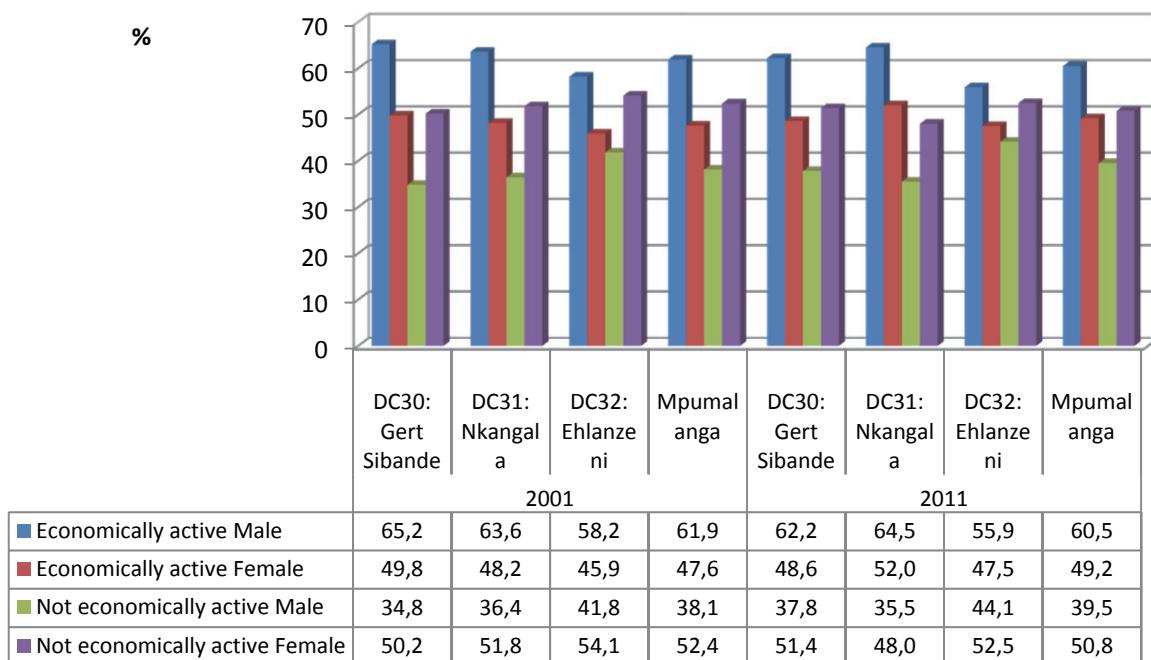

3.8 The labour market

Figure 3.17: Percentage of economically active and inactive population by district municipality, Census 2001 and Census 2011

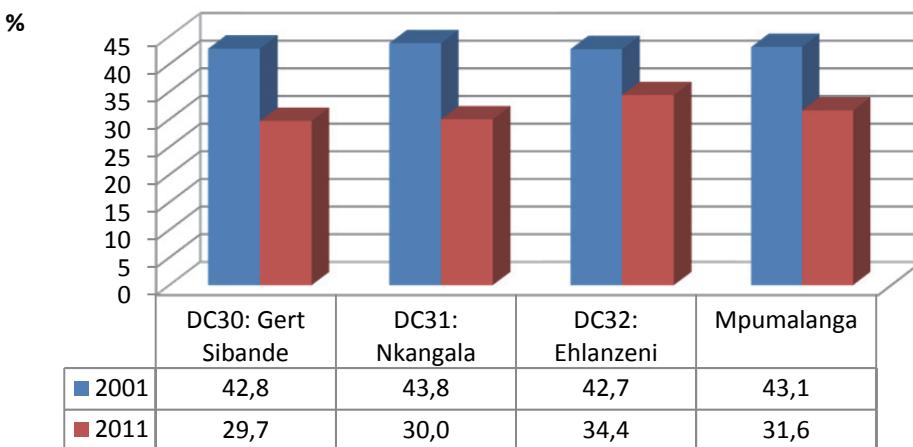

The above figure shows that the proportion of the economically active population in Mpumalanga has slightly increased from 54,4% in 2001 to 54,8% in 2011, particularly in Nkangala district (an increase from 55,6% to 58,4%). Whereas Ehlanzeni and Gert Sibande districts witnessed a decrease in the proportion of the economically active population (from 51,6% to 51,4% and from 57,1% to 55,3% respectively).

Figure 3.18: Percentage of economically active and inactive population by sex and district municipality, Census 2001 and Census 2011

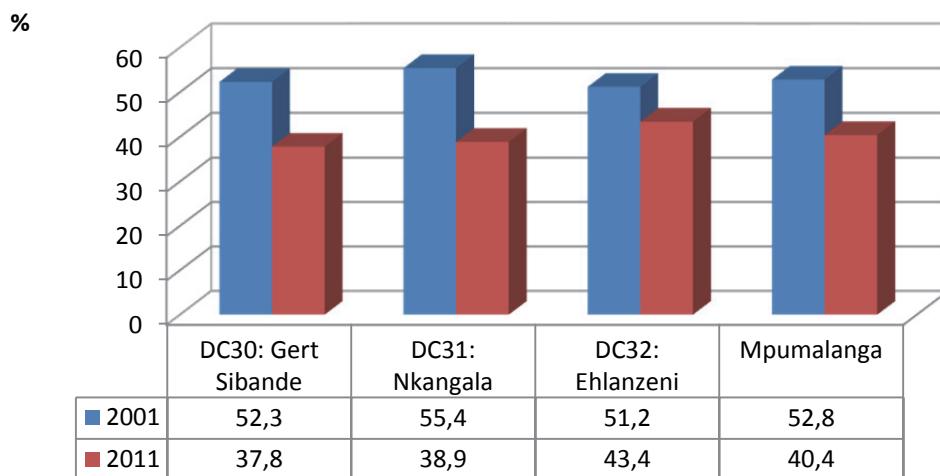

The above figure shows that the proportion of economically active males has slightly decreased from 61,9% to 60,5% in Mpumalanga, particularly in Ehlanzeni and Gert Sibande districts (respectively decreased from 58,2% to 55,9% and from 65,2% to 62,2%), between Census 2001 and 2011. Nkangala district witnessed an increase in the proportion of the economically active male population (from 63,6% to 64,5%).

The proportion of the economically active female population has increased from 47,6% to 49,2% in Mpumalanga, particularly in Ehlanzeni and Nkangala districts (respectively increased from 45,9% to 47,5% and from 48,2% to 52,0%) between Census 2001 and 2011. Gert Sibande district witnessed a decrease (from 49,8% to 48,6%).

Figure 3.19: Unemployment rates by district municipality, Census 2001 and Census 2011

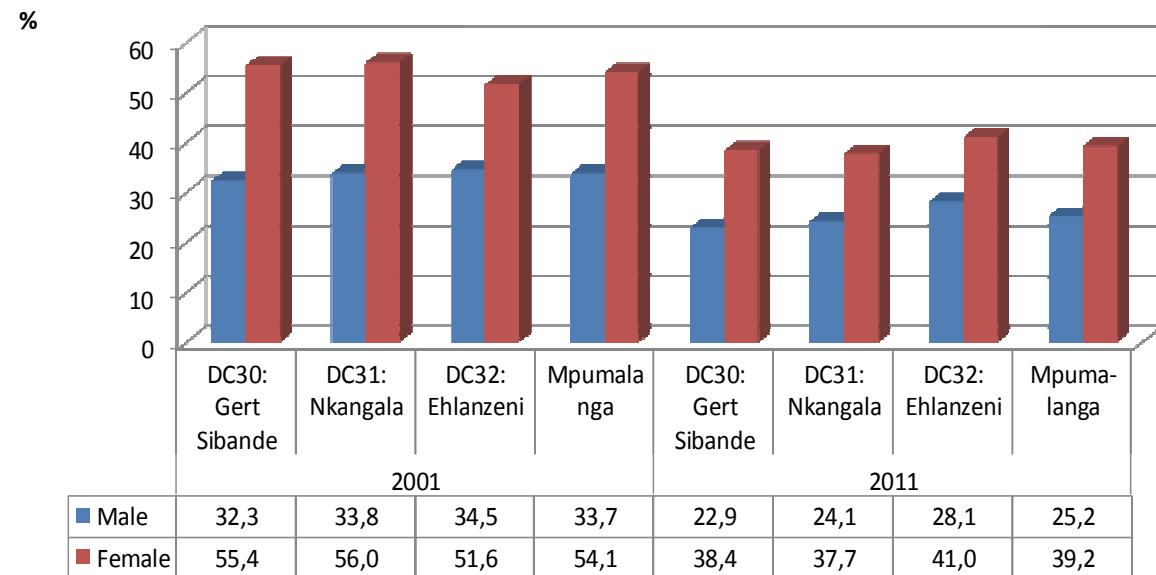

The figure above shows that the unemployment rate has decreased from 43,1% to 31,6% in Mpumalanga, and a congruent trend can be observed for the three districts, between Census 2001 and Census 2011.

In 2011, Ehlanzeni (34,4%) was the only district to record an unemployment rate that was higher than the provincial average of 31,6%.

Figure 3.20: Youth unemployment rate by district municipality, Census 2001 and Census 2011

The figure above shows that the unemployment rate for the youth has decreased from 52,8% to 40,4% in Mpumalanga. The same trend can be observed for the three districts, between Census 2001 and 2011. In 2011, Ehlanzeni (at 43,4%) was the only district to record an unemployment rate that was higher than the provincial average of 40,4%.

Figure 3.21: Unemployment rates by sex and district municipality, Census 2001 and Census 2011

The above figure shows that the unemployment rate for both males and females has decreased from 33,7% to 25,2% and 54,1% to 39,2% respectively in Mpumalanga, and a congruent trend can be observed for the three districts, between Census 2001 and 2011. Despite these decreases, the unemployment rate for females remained significantly higher than that of males.

In 2011, Ehlanzeni was the only district to record a female (41,0%) and male (28,1%) unemployment rate that was higher than the provincial average of 38,2% and 25,2% respectively.

Chapter 4: Results pertaining to households

4.1 Households

Table 4.1: Number of households by district and local municipality, censuses of 1996, 2001 and 2011

Municipality	1996	2001	2011
Gert Sibande	173 053	211 618	273 490
Albert Luthuli	35 543	39 652	47 705
Msukaligwa	24 876	29 689	40 932
Mkhondo	18 697	27 888	37 433
Pixley Ka Seme	14 538	18 002	19 838
Lekwa	20 463	25 199	31 071
Dipaleseng	9 450	9 474	12 637
Govan Mbeki	49 487	61 714	83 874
Nkangala	207 290	245 429	356 911
Victor Khanye	12 471	13 428	20 548
Emalahleni	56 290	74 917	119 874
Steve Tshwete	33 619	36 229	64 971
Emakhazeni	9 272	9 723	13 722
Thembisile	47 472	57 548	75 634
Dr JS Moroka	48 165	53 583	62 162
Ehlanzeni	289 458	328 377	445 087
Thaba Chweu	20 071	21 257	33 352
Mbombela	91 584	112 321	161 773
Umjindi	11 613	14 458	20 255
Nkomazi	53 043	71 840	95 509
Bushbuckridge	113 147	108 500	134 197
Mpumalanga	669 801	785 424	1 075 488
South Africa	9 059 571	11 205 705	14 450 161

The above table shows that the number of households in Mpumalanga increased from 785 424 in 2001 to 1 075 488 in 2011. In 2011, the district municipality with the highest number of households was Ehlanzeni (445 087 households), while Gert Sibande recorded the lowest number (273 490 households). Mbombela local municipality had the highest number of households (161 773), while Dipaleseng recorded the lowest number (12 637).

Table 4.2: Number of persons enumerated in households by district and local municipality, censuses of 1996, 2001 and 2011

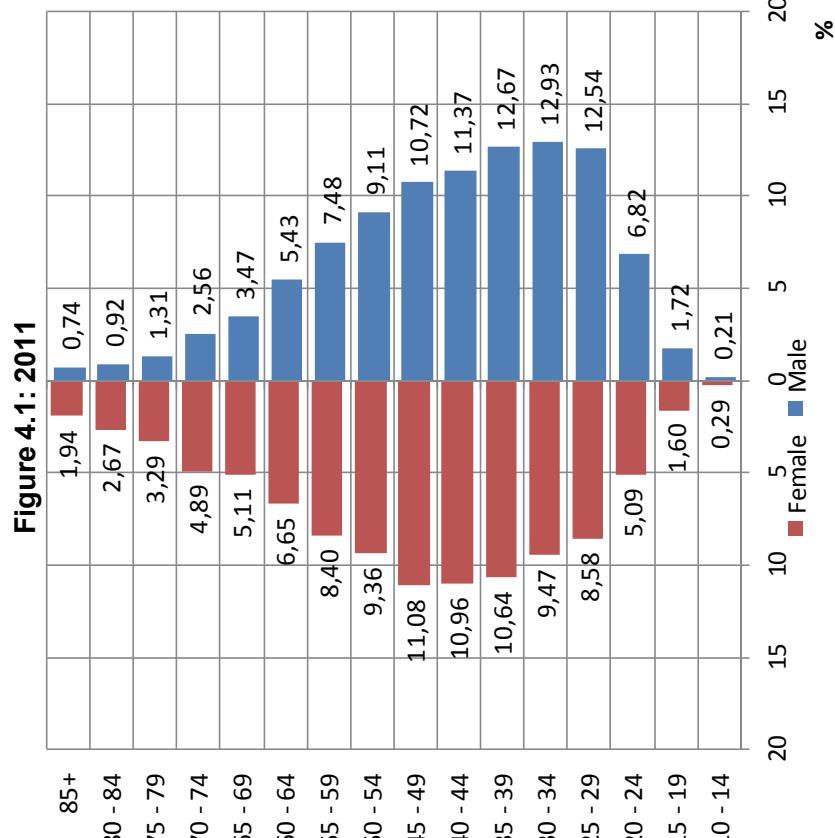

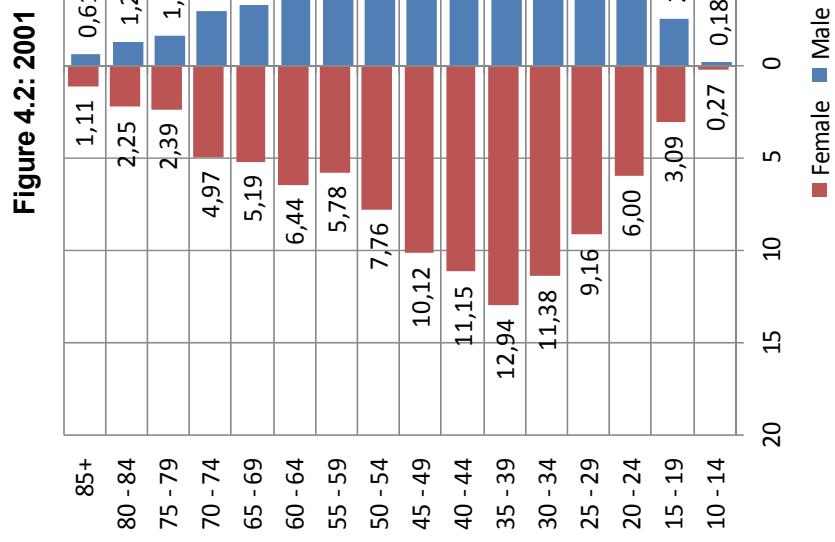

Municipality	Census 1996	Census 2001	Census 2011
Gert Sibande	770 953	874 436	1 012 735
Albert Luthuli	180 754	184 050	183 314
Msukaligwa	102 537	121 723	143 632

South Africa	39 201 672	43 369 667	49 609 278

Table 4.2 shows that the number of persons enumerated in households in Mpumalanga increased from 3 258 562 in 2001 to 3 939 672 in 2011. In 2011, the district municipality with the highest number of persons was Ehlanzeni (1 651 015), while Gert Sibande recorded the lowest number (1 012 735). Mbombela local municipality had the highest number of persons (573 877), followed by Bushbuckridge (537 725), while Dipaleseng recorded the lowest number (41 793).

Table 4.3: Average household size by district and local municipality, censuses of 1996, 2001 and 2011

Municipality	Average household size		
	Census 1996	Census 2001	Census 2011
Gert Sibande	4,5	4,1	3,8
Albert Luthuli	5,1	4,6	3,9
Msukaligwa	4,1	4,1	3,6
Mkhondo	5,2	5,0	4,6
Pixley Ka Seme	4,7	4,4	4,2
Lekwa	4,3	4,0	3,7
Dipaleseng	4,1	4,0	3,4
Govan Mbeki	3,9	3,4	3,5
Nkangala	4,6	4,0	3,7

Emalahleni	4,1	3,5	3,3
Steve Tshwete	3,9	3,8	3,5
Emakhazeni	3,9	4,1	3,4
Thembisile	5,1	4,4	4,1
Dr JS Moroka	5,3	4,5	4,0
Ehlanzeni	4,6	4,2	3,8
Thaba Chweu	3,1	3,3	2,9
Mbombela	4,5	4,0	3,6
Umjindi	3,7	3,3	3,4
Nkomazi	5,2	4,5	4,1
Bushbuckridge	4,8	4,6	4,0
Mpumalanga	4,6	4,1	3,8

The above table shows that the average household size in Mpumalanga decreased from 4,1 in 2001 to 3,8 in 2011. In 2011, the district municipalities with the highest average household size were Ehlanzeni and Gert Sibande (both with 3,8), whilst Nkangala recorded a slightly lower household size of 3,7. Mkhondo local municipality had the highest average household size of 4,6, while Thaba Chweu recorded the lowest with 2,9.

Figure 4.1: Household heads by sex and age, Census 2011**Figure 4.2: Household heads by sex and age, Census 2001**

The above figures give the percentage distribution of household heads by age and sex in Mpumalanga. The proportion of households headed by children aged 10–14 years has increased for both males and females from 0,27% to 0,29% and from 0,18% to 0,21% for males and females respectively between 2001 and 2011. In 2011, fairly larger proportions of males than females were household heads from age groups 15 to 44 years, while in 2001, larger proportions of males than females were household heads from age groups 25 to 59. A larger proportion of females than males became household heads at higher ages in both 2001 and 2011.

4.2 Housing conditions

Figure 4.3: Percentage distribution of households by type of dwelling and by district municipality, censuses of 1996, 2001 and 2011

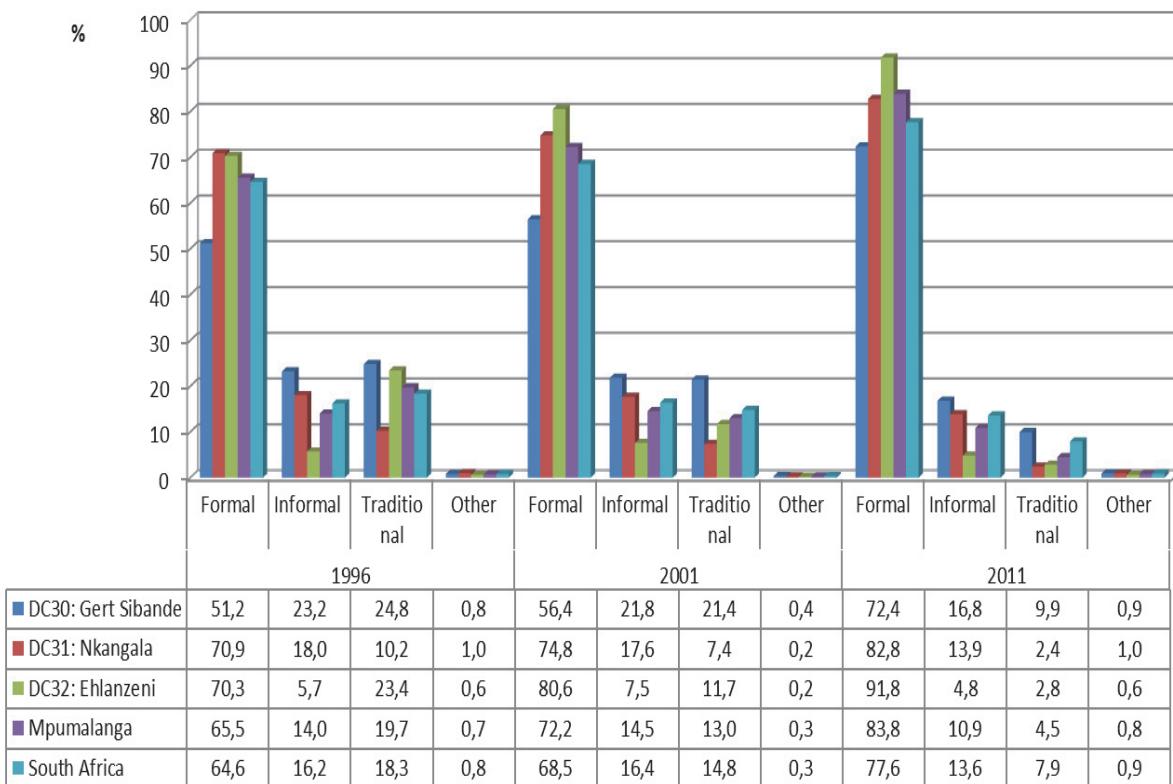

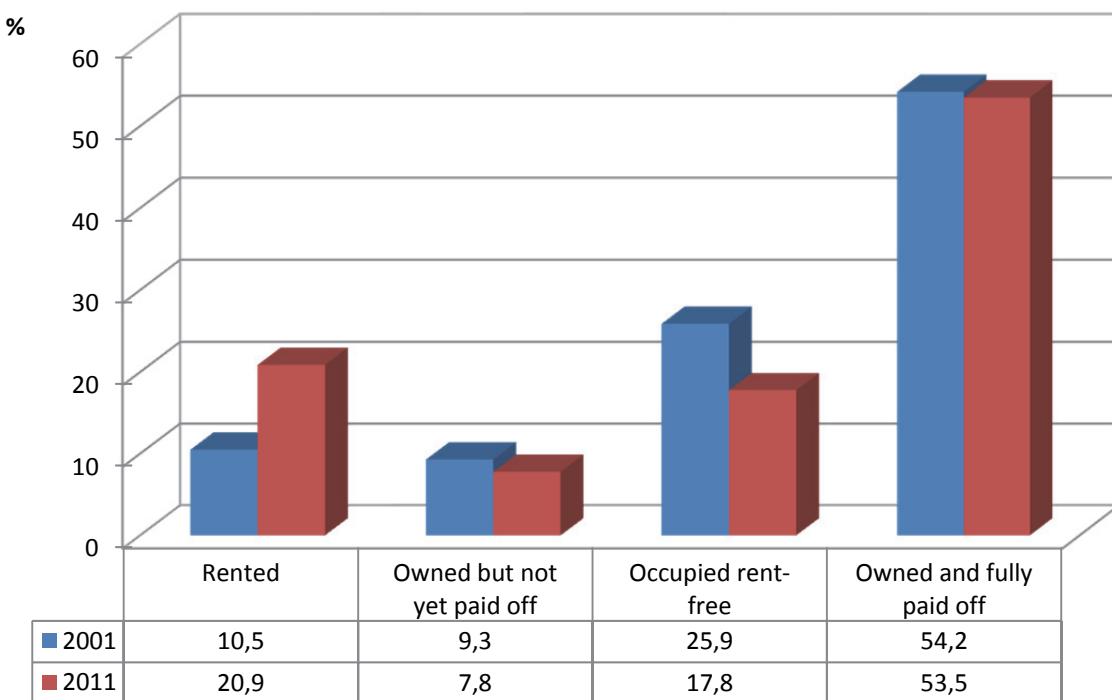

Figure 4.3 shows that the proportion of households living informal dwellings in Mpumalanga increased from 72,2% to 83,8% between 2001 and 2011. In 2011, Ehlanzeni district recorded the highest proportion (91,8%), followed by Nkangala at 82,8%. Both districts recorded percentages above the national average of 77,6%, whereas Gert Sibande recorded the lowest proportion (72,4%). The proportion of households living in informal and traditional dwellings has significantly decreased.

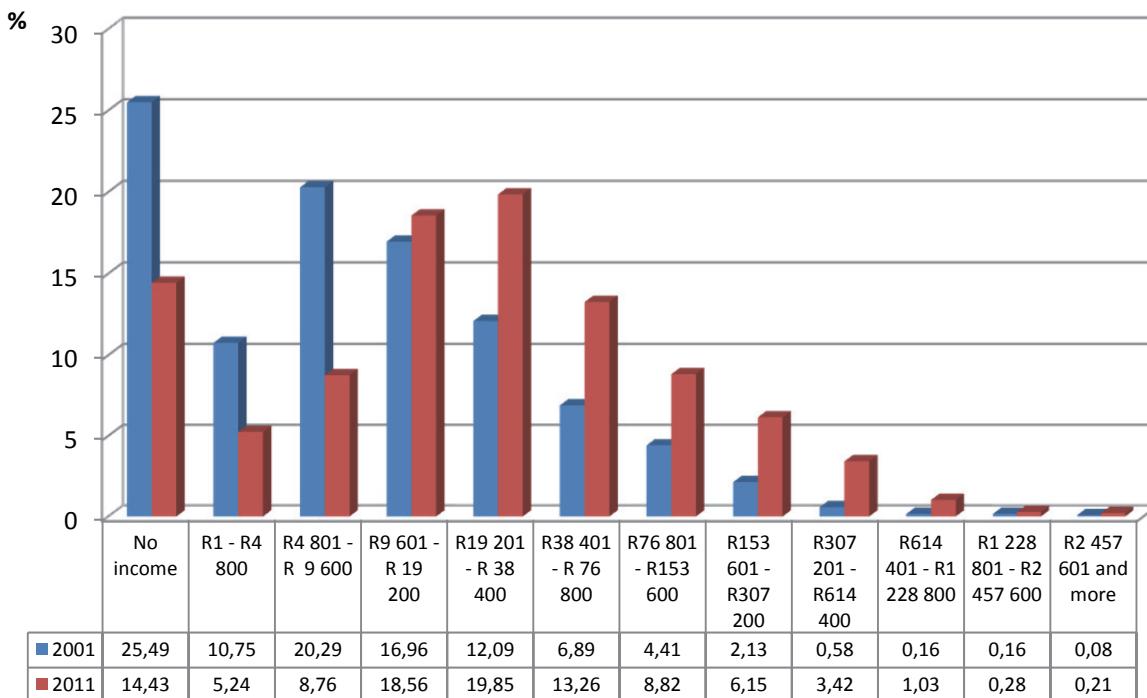

Figure 4.4: Percentage distribution of households by type of tenure status, Census 2001 and Census 2011

Excludes "other" category

The proportion of households that reported living in rented dwellings in Mpumalanga has significantly increased from 10,5% to 20,9% between 2001 and 2011, whereas the proportion of those who reported that they 'owned but had not yet paid off', 'occupied rent-free' and 'owned and had fully paid off' their dwelling has decreased between the two censuses.

Figure 4.5: Percentage distribution of households by annual average household income, Census 2001 and Census 2011

The above figure shows the distribution of households by annual average household income in Mpumalanga between Census 2001 and Census 2011. The proportion of households that reported having no income has decreased from just above a quarter (25,5%) in 2001 to 14,4% in 2011. A similar trend can be observed for those households that earned from R1 to R4 800 and those that earned from R4 801 to R9 600. However, the proportion of households that received R9 601 and above has increased during the above period.

Figure 4.6: Percentage distribution of households by type of refuse disposal and by district municipality, censuses of 1996, 2001 and 2011

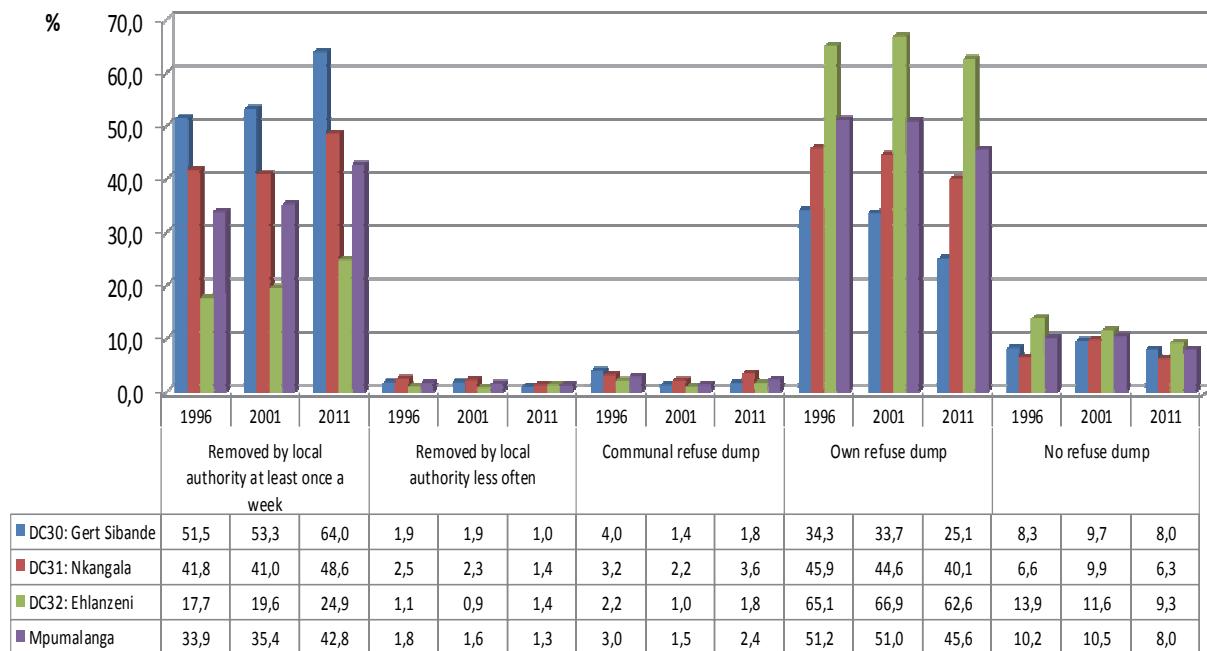

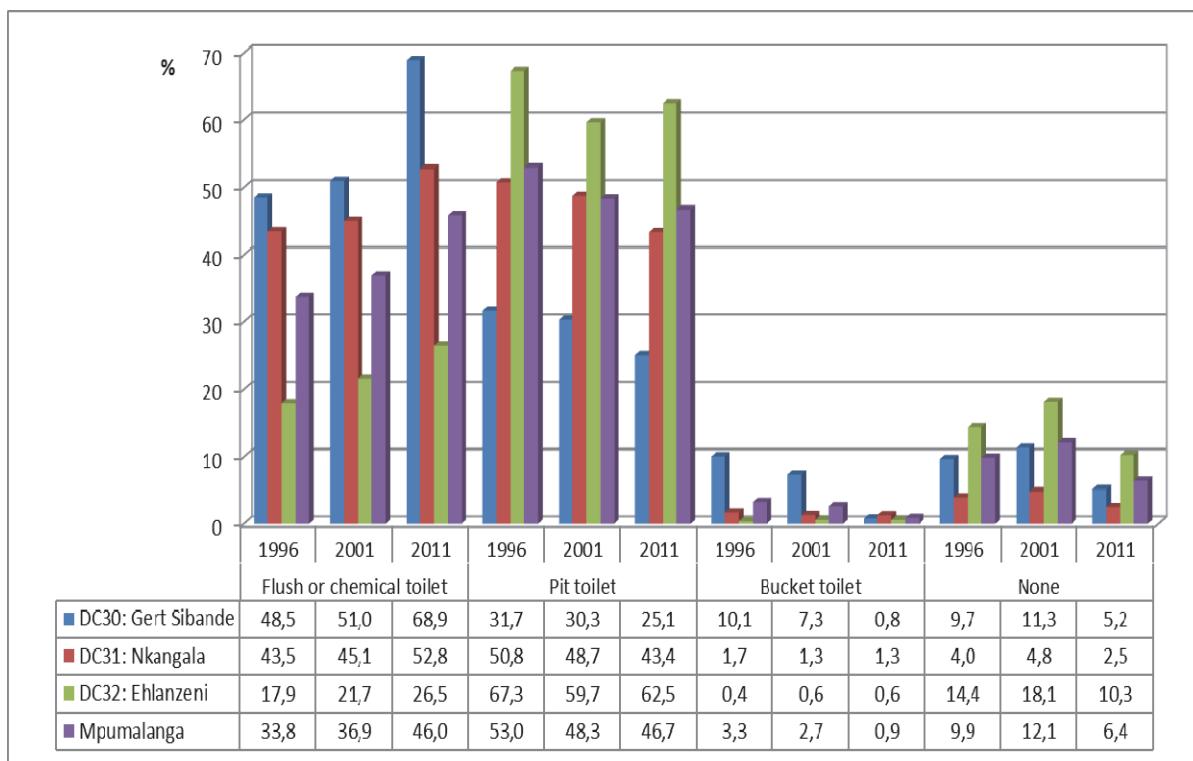

Figure 4.6 shows that the proportion of households whose refuse was removed by local authority at least once a week in Mpumalanga has increased from 35,4% to 42,8% between 2001 and 2011. The same trend is depicted for the three district municipalities. Despite the above increases, the proportion of households whose refuse was removed by local authority at least once a week remained significantly lower in Ehlanzeni district when compared to the other two districts. In 2011, Ehlanzeni district also recorded the highest proportion of households that had their own refuse dump (62,6%), which was also above the provincial average of 45,6%.

Figure 4.7: Percentage distribution of households by type of toilet facility and by district municipality, censuses of 1996, 2001 and 2011

The above figure shows that the proportion of households using flush or chemical toilets in Mpumalanga has increased from 36,9% to 46,0% between 2001 and 2011. A similar trend can be observed for the three district municipalities. Despite the increases, the proportion of households with flush or chemical toilets in Ehlanzeni district remained significantly lower when compared to the other two districts. In 2011, Ehlanzeni district recorded the highest proportion of households with pit toilets (62,5%), which was also above the provincial average of 46,7%.

Figure 4.8: Percentage distribution of households by type of energy or fuel used for lighting and by district municipality, censuses of 1996, 2001 and 2011

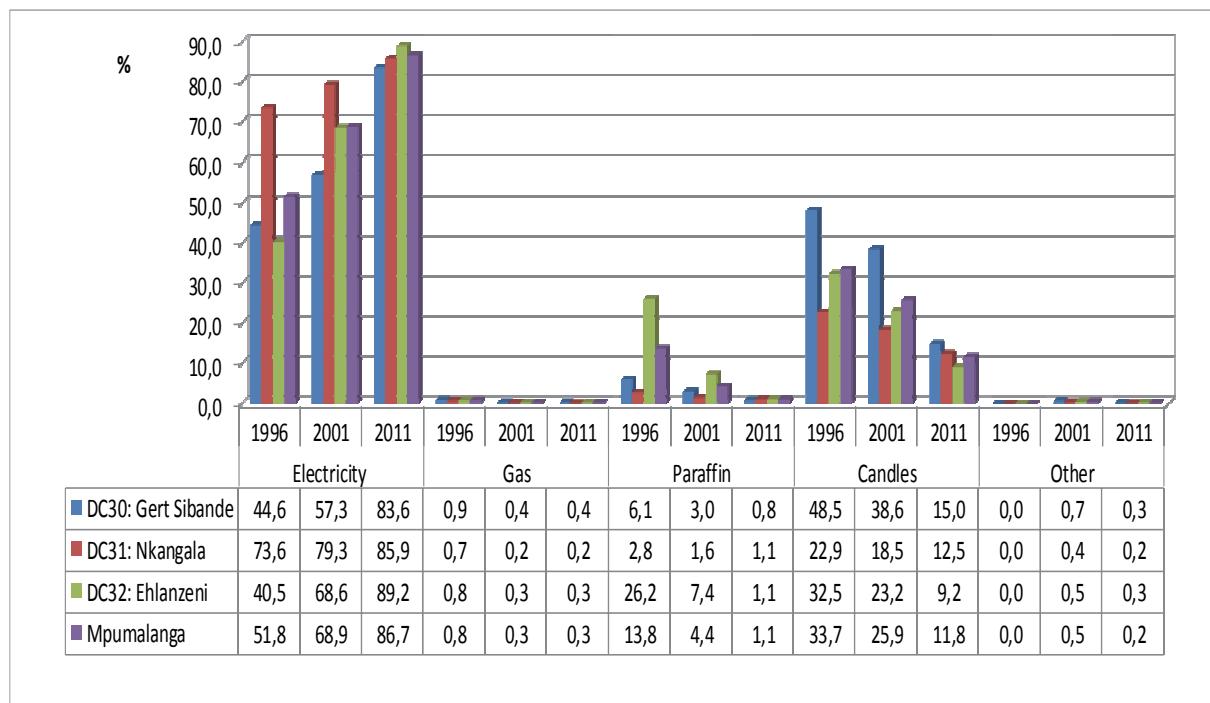

Figure 4.8 shows the percentage distribution of households by type of energy used for lighting by district municipality. The proportion of households using electricity for lighting in Mpumalanga has increased from 68,9% to 86,7% between 2001 and 2011. Among the districts, Ehlanzeni recorded the highest percentage of households using electricity for lighting with 89,2% in 2011. Significant decreases can be observed in households using candles for lighting, provincially and by district municipality.

Figure 4.9: Percentage distribution of households by type of energy or fuel used for cooking and by district municipality, censuses of 1996, 2001 and 2011

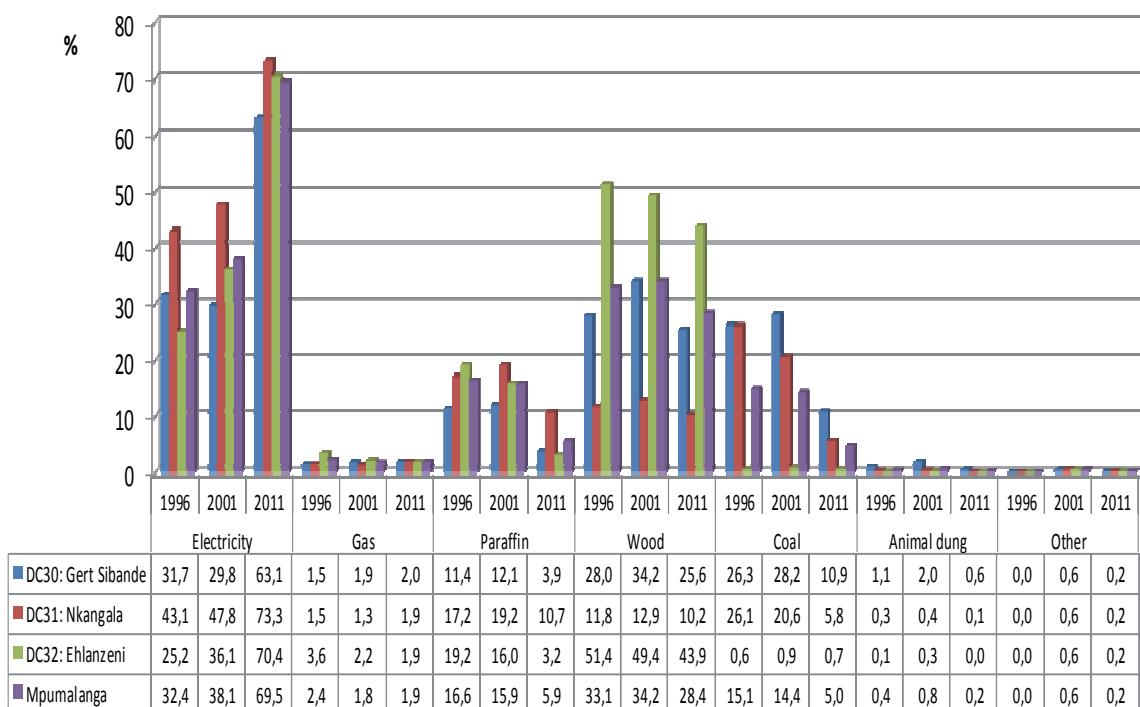

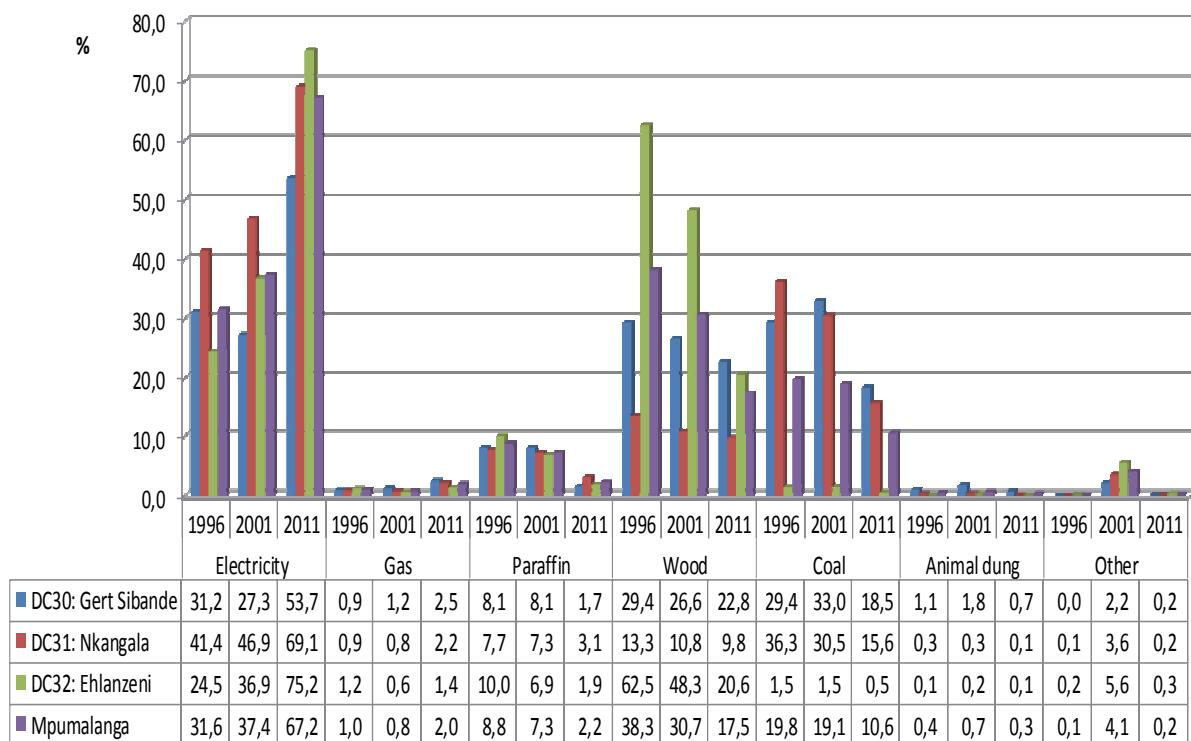

Figure 4.9 gives the percentage distribution of households by type of energy used for cooking, by district municipality. The proportion of households using electricity for cooking in Mpumalanga has increased from 38,1% to 69,5% between 2001 and 2011. The same trend is depicted among the three district municipalities. In 2011, the proportion of households that reported the usage of wood was highest in Ehlanzeni with 43,9%, followed by Gert Sibande with 25,6%, whilst Nkangala recorded the lowest with 10,2%. The proportion of households that used coal was highest in Gert Sibande with 10,9%, followed by Nkangala with 5,8%, whilst Ehlanzeni recorded the lowest proportion (0,7%).

Figure 4.10: Percentage distribution of households by type of energy or fuel used for heating and by district municipality, censuses of 1996, 2001 and 2011

The above figure shows the percentage distribution of households by type of energy used for heating, by district municipality. The proportion of households using electricity for heating in Mpumalanga has increased from 37,4% to 67,2% between 2001 and 2011. A similar trend can be observed among the three district municipalities. In 2011, the proportion of households that reported the usage of wood was highest in Gert Sibande with 22,8%, followed by Ehlanzeni with 20,6%, whilst Nkangala recorded the lowest proportion (9,8%). Gert Sibande district reported the highest proportion of households that used coal for heating (18,5%), followed by Nkangala (15,6%), whilst Ehlanzeni recorded the lowest proportion (0,5%). Significant decreases can be observed for the proportions of households using paraffin for heating, provincially and by district municipality.

Figure 4.11: Percentage of households having access to piped water by district municipality, censuses of 1996, 2001 and 2011

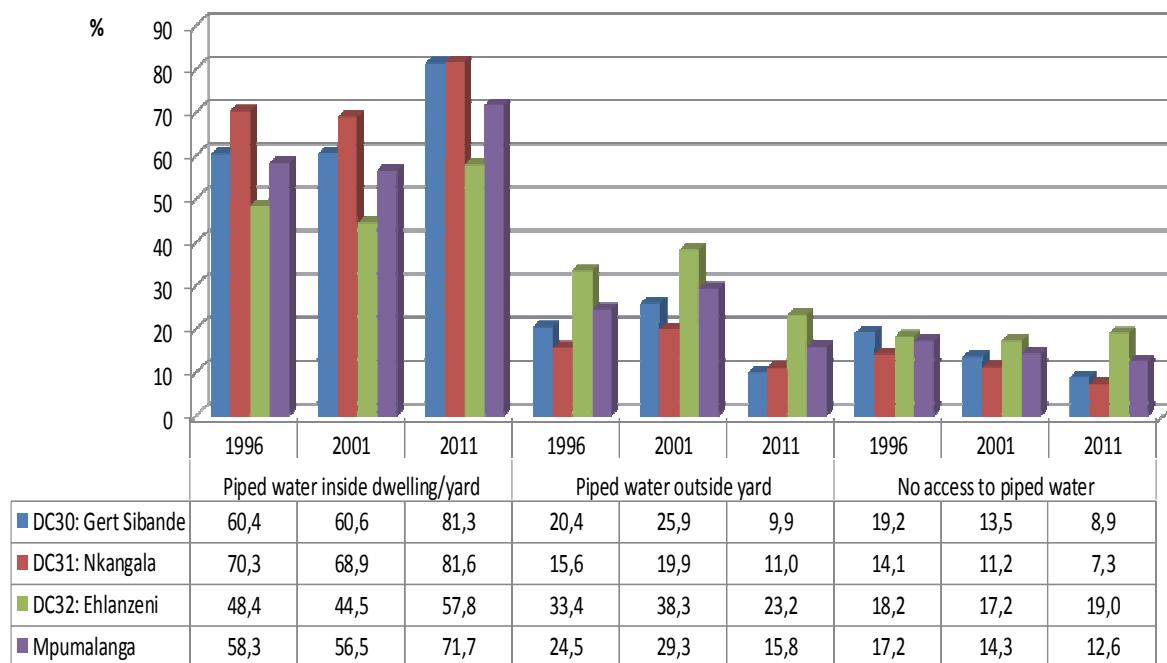

Figure 4.11 shows that the proportion of households with access to piped water inside the dwelling and/or yard in Mpumalanga has increased from 56,5% to 71,7% between 2001 and 2011. The figure depicts the same trend for the three district municipalities. Despite the increases, the proportion of households with access to piped water inside the dwelling and/or yard in Ehlanzeni district remained lower when compared to the other two districts. In 2011, Ehlanzeni district recorded the highest proportion of households with no access to piped water with 19%, which was above the provincial average of 12,6%.

4.3 Household goods

Figure 4.12: Percentage of households owning specific household goods by district municipality, censuses of 1996, 2001 and 2011

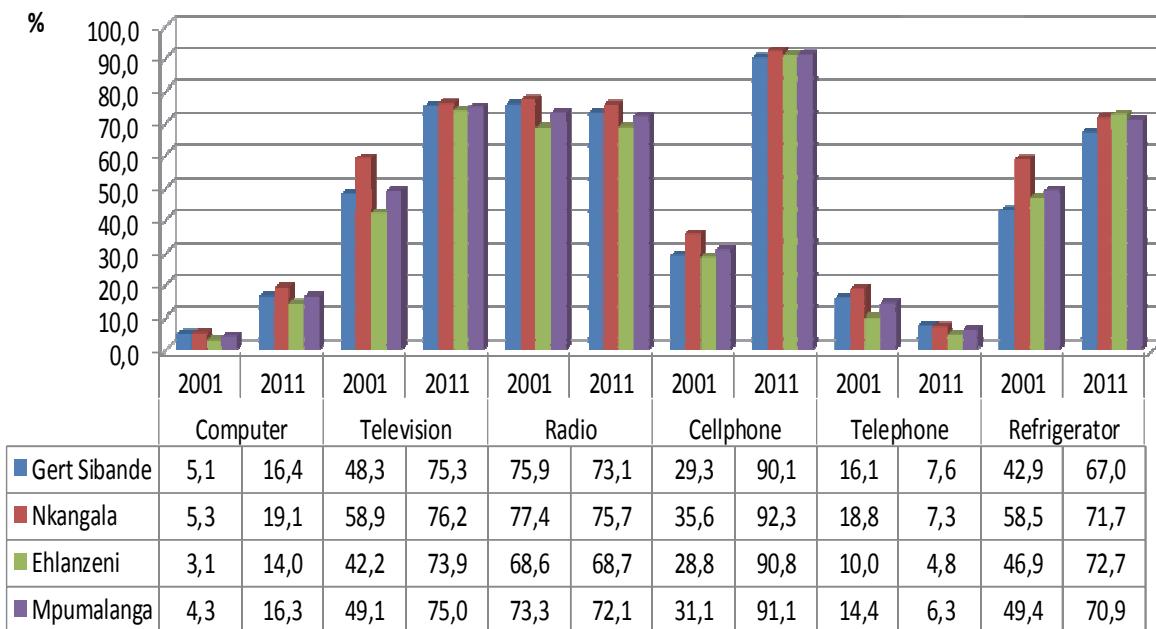

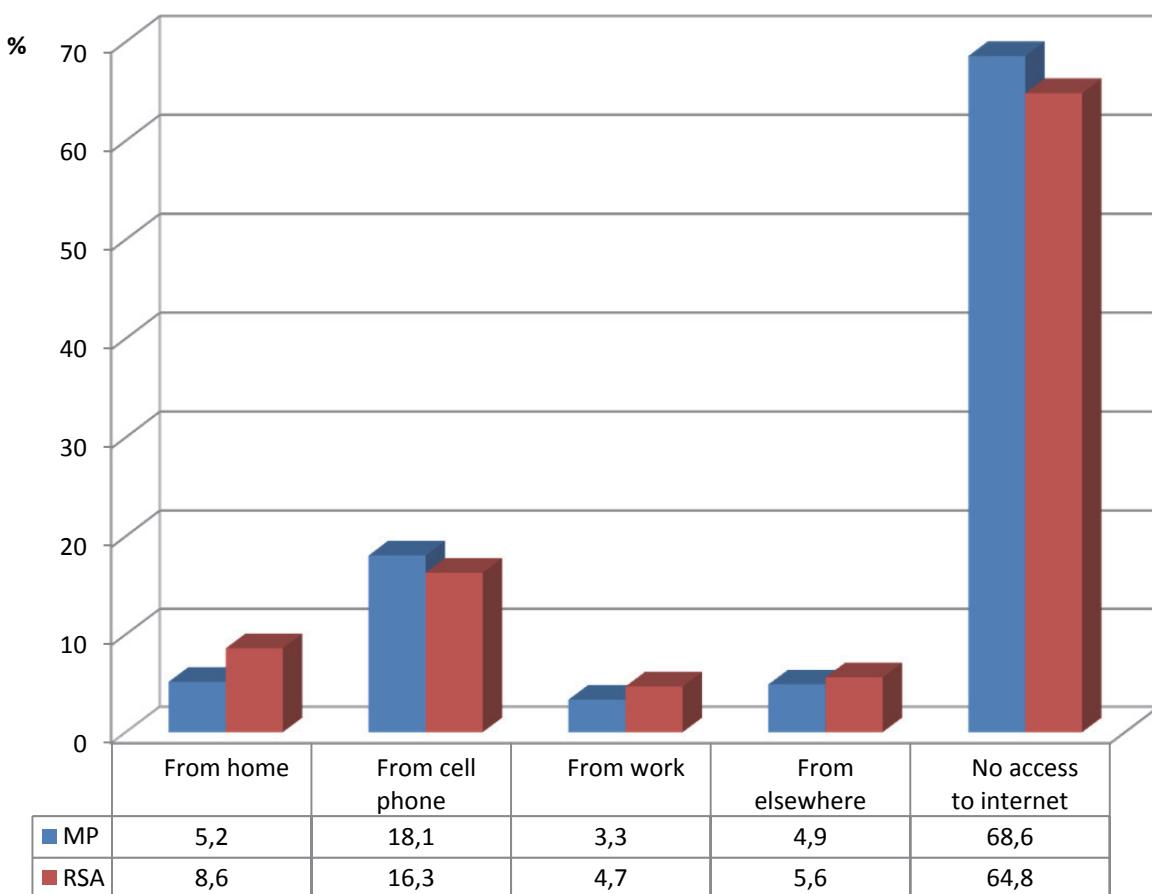

Figure 4.12 shows the percentage of households owning specific household goods, by district municipality. Overall, the proportion of households that reported owning computers, televisions, cellphones and refrigerators in Mpumalanga has increased respectively from just 4,3% to 16,3%, from just below 50% to 75,0%, from 31,1% to 91,1% and from just below 50% to 70,9%, between 2001 and 2011. The three district municipalities show the same trend. Despite the increases, the proportion of households in 2011 with access to computers in Mpumalanga and all the districts was significantly lower than the other categories, except for the proportion of households that had a landline/telephone, which has declined. Comparisons among the districts show that Ehlanzeni district recorded the lowest proportion of households with access to computers in 2011 with only 14%.

Figure 4.13: Access to the Internet, Census 2011

The proportion of households that had access to the Internet from home, from work and from elsewhere in Mpumalanga, was 5,2%, 3,3% and 4,9% respectively and was below the national figures of 8,6%, 4,7% and 5,6% respectively.

Chapter 5: Conclusion

As highlighted in the introduction, Mpumalanga is one of the nine provinces of South Africa. It is situated in the east, and its name means, literally, ‘the place where the sun rises from’. Mpumalanga occupies about 6,3% (76 495 km²) of the land surface area of South Africa. Mpumalanga covers the area between Witbank in the west and Komatipoort in the east. On its southern borders lie the Free State and KwaZulu-Natal, and in the north, the Limpopo provinces. Gauteng borders it in the west. The neighbouring countries of Swaziland and Mozambique also share borders with it in the east.

Demographics of Mpumalanga

In 1996, Mpumalanga had a total population of 3 123 869, approximately 7,7% of South Africa’s total population; this increased to 3 365 554 (approximately 7,5% of South Africa’s total population) in 2001, and then to 4 039 939 (approximately 7,8% of South Africa’s total population) in 2011. Ehlanzeni district comprised 42% of the population, followed by Nkangala with 32,4% and then Gert Sibande with 25,8%.

The population of the province comprised predominantly black Africans who accounted for about 91% of its total population in 2011. The province had a higher proportion of women than men (95 men per 100 women) in 2007.

The highest proportion of the population were those aged 5–9 years (12,7%) recorded in Census 1996, whereas the highest proportion reported in Census 2001 were those aged 10–14 years (12,6%), whilst the highest proportion reported in Census 2011 was the age group 0–4 years at 11,4%.

The dependency ratio has decreased over the years; the province recorded a dependency ratio of 56 in 2011, which implies a decrease from the 67 and 73,6 recorded for 2001 and 1996 respectively.

Migration

Overall, Mpumalanga had a net gain of 52 845 people. Most people who emigrated from the province went to Gauteng province with a net loss of 38,1%, and most immigrants came from outside the country, with a net gain of 28,9%.

General health and functioning

More than 7% of the Mpumalanga population were disabled. The proportion of males and females who were disabled was 6,2% and 7,8% respectively.

Education

Overall, school attendance has increased from 73,5% to 74,8% in Mpumalanga for those aged 5–24 years. Focusing on the compulsory nine years that a child should be attending school, it can be observed that the proportion of those attending school has increased from just above 88% in 1996 to about 96% in 2001, and escalated further to about 98% in 2011. The proportion of those with a higher education has slightly increased from 6% in 2001 to just over 10% in 2011.

The labour market

The unemployment rate has decreased from 43,1% to 31,6% in Mpumalanga, between Census 2001 and Census 2011. In 2011, the unemployment rate in Ehlanzeni district remained higher than the provincial average at 34,4%. Youth and women were the most affected (40,4% and 39,2% respectively).

General household information

Mpumalanga had a total of 1 075 488 households in 2011, of which about 42% were recorded in Ehlanzeni district, followed by Nkangala with 31% and Gert Sibande with about 27%. Approximately 40% of the households in Mpumalanga in 2011 were headed by females, particularly in the Ehlanzeni district (44% female-headed households). There was a slight increase in the proportion of households headed by children aged 10–14 years (from 0,22% to 0,24%) between 2001 and 2011.

Housing conditions

The proportion of households living in formal dwellings in Mpumalanga increased from 72,2% to 83,8% between 2001 and 2011. In 2011, Ehlanzeni had the highest proportion of these households (about 92%).

The proportion of households that owned and had fully paid off for their dwellings in Mpumalanga has slightly decreased from 2001 and 2011, whilst the proportion of households that rented their dwellings has significantly increased from 15,5% to 20,9% between 2001 and 2011.

The proportion of households in Mpumalanga with no income has decreased by more than a quarter in 2001 to 14,4% in 2011. However, the proportion of households that earned R9 601 and more has increased.

The proportion of households whose refuse was removed by a local authority at least once a week in Mpumalanga has increased from 35,4% to 42,8% between 2001 and 2011. The three district municipalities also show the same trend. Despite these increases, the percentage of households whose refuse was removed by a local authority at least once a week in Ehlanzeni district remained significantly lower when compared to the other two districts.

The proportion of households using flush or chemical toilets in Mpumalanga has increased from 36,9% to 46% between 2001 and 2011. A similar trend can be observed for all three district municipalities. Despite these increases, the proportion of households using pit latrines remained the highest in Ehlanzeni district.

The proportion of households using electricity for lighting in Mpumalanga has increased from 68,9% to 86,7% between 2001 and 2011. Among the districts, Ehlanzeni recorded the highest percentage of households using electricity for lighting with 89,2% in 2011.

The proportion of households using electricity for cooking in Mpumalanga has increased from 38,1% to 69,5% between 2001 and 2011. A similar trend can be observed among all three district municipalities.

The proportion of households using electricity for heating in Mpumalanga has increased from 37,4% to 67,2% between 2001 and 2011. A similar trend can be observed among all three district municipalities.

The proportion of households with access to piped water inside the dwelling and/or yard in Mpumalanga has increased from 56,5% to 71,7% between 2001 and 2011. This increase can be observed in all three district municipalities. Despite the increases, the proportion of households with access to piped water inside the dwelling and/or yard in Ehlanzeni district remained significantly lower when compared to the other two districts.

Household goods

Overall, there was an increase in the proportion of households in Mpumalanga that had access to computers (4,3% to 16,3%), televisions (49,1% to 75,0%), cellphones (31,1% to 91,1%) and refrigerators (49,4% to 50,9%).

In Mpumalanga, 5,15% of households had access to the Internet from home, 3,33% had access from work, and 4,9% had access from elsewhere. These percentages are below the national figures of 8,6%, 4,7% and 5,6% respectively, and the proportion of households with no access to the Internet in Mpumalanga was higher than the national average.

Terms and definitions

Census (Population Census)

The process of counting the number of people, at a given point in time in a country, and collecting information about their demographic, social and economic characteristics. After data collection, the process includes the processing, analysis and dissemination of the information collected.

Census night

The night before the census day. It is the decisive point of time for being included in the census (midnight on that night).

De facto census

A census in which people are enumerated according to where they were on census night. In this case, at midnight on the night of 9/10 October 2011.

De jure census

A census in which people are enumerated according to where they usually live.

Bucket toilet system

A toilet system with a pail or other removable receptacle placed directly under the toilet seat, and where no water or chemicals is used.

Disability

Difficulties encountered in functioning due to body impairments or activity limitation, with or without assistive devices.

Dwelling unit

Structure or part of a structure or group of structures occupied or meant to be occupied by one or more than one household. Includes structure or part of a structure which is vacant and/or under construction, but can be lived in at the time of the survey. Includes units in collective living quarters, unlike housing units. Dwelling units may therefore comprise housing units plus units in collective living quarters when applicable. (Examples of each are a house, a group of huts, and a flat.)

A dwelling unit has a separate entrance from outside or from a common space, as in a block of flats. Premises not intended for use as living quarters, but used for human habitation at the time of the census, such as a barn, warehouse, etc., are also classified as dwelling units for census purposes.

Emigrant

A person who leaves a country with the intention of staying in the country of arrival.

Employed

Persons who work for pay; profit or family gain in the reference period.

Enumeration area

An enumeration area (EA) is the smallest geographical unit (piece of land) into which the country is divided for census or survey purposes. EAs typically contain between 100 and 250 households. Each EA is expected to have clearly defined boundaries.

Formal dwelling

A structure built according to approved plans, i.e. house on a separate stand, flat or apartment, townhouse, room in a backyard or rooms or flatlet elsewhere.

Health and functioning

Whether a person has difficulty in seeing, hearing, communicating, walking or climbing stairs, remembering or concentrating, and self-care such as washing all over, dressing or feeding.

Household

A household is a group of persons who live together and provide themselves jointly with food or other essentials for living, or a single person who lives alone. Note that a household is not necessarily the same as a family.

Household head

A person recognised as such by household, usually the main decision-maker, or the person who owns or rents the dwelling, or the person who is the main breadwinner. The head can be either male or female. If two people are equal decision-makers, the oldest can be named as the household head.

Household income

All receipts by all members of a household, in cash and in kind, in exchange for employment, or in return for capital investment, or receipts obtained from other sources such as pension.

Immigrant

A person who enters a country from another country with the intention of staying in that country.

In-migrants

A person who moves from one part of a country to another part with the intention of staying where they move to. This person would be regarded as an in-migrant at the place where they move to.

Informal dwelling

Makeshift structure not approved by a local authority and not intended as a permanent dwelling. Typically built with found materials (corrugated iron, cardboard, plastic, etc.). Contrasted with formal dwelling and traditional dwelling.

Labour absorption rate

The proportion of the working-age population that is employed.

Labour force

All employed and unemployed persons of working age.

Labour force participation rate

Labour force as a percentage of the working-age population.

Not economically active

Persons who were neither employed or unemployed (e.g. full-time students; retired persons; and homemakers who did not want to work).

Out-migrants

A person who moves from one part of a country to another part with the intention of staying where they move to. This person would be regarded as an out-migrant at the place where they move from.

Post-enumeration survey

A sample survey conducted immediately after a census to evaluate the census. Results are used to make adjustments for the census undercount or overcount.

Sex

Biological distinction between males and females.

Traditional dwelling

A dwelling made primarily of clay, mud, reeds or other locally available natural materials. This is a general term that includes huts, rondavels, etc. Such dwellings can be found as single units or in clusters.

Unemployed (official definition)

Persons who did not work, but who looked for work and were available to work in the reference period.

Unemployment rate

Unemployed persons as a percentage of the labour force.

Unspecified

All cases whereby an answer was expected but was left blank during enumeration.

Wattle and daub

Traditional construction method whereby walls are built with wooden sticks/poles and covered with mud or a mixture of mud and clay.

Working-age population

Persons aged 15–64 years.
