PREFACE

This report contains the final supply and use tables (SU-tables) for 2005, estimated according to the recommendations of the 1993 System of National Accounts (1993 SNA), which Statistics South Africa (Stats SA) has been implementing since 1995. They are closely linked to the estimates for the gross domestic product (GDP) (Statistical Release P0441) published on 24 November 2009.

The SU-tables, often regarded as the cornerstone of the 1993 SNA, have both statistical and analytical functions. As a statistical tool they serve as a co-ordinating framework for economic statistics, both conceptually for ensuring the consistency of the definitions and classifications used, and as an accounting framework for ensuring the numerical consistency of data obtained from different sources (i.e. industrial surveys, household surveys, investment surveys, foreign trade statistics).

As an analytical tool, the tables serve as a basis for calculating the economic data contained in the national accounts, and for detecting weaknesses in the economic data. Moreover, they are conveniently integrated into macro-economic models in order to analyse the link between final demand and industrial output levels.

The SU-tables also have many other uses. These include the extension of the tables to -

- symmetric input-output tables, i.e. tables focusing on the inter-relationships between industries in an economy with respect to the production and uses of its products and the products imported from abroad;
- social accounting matrices, i.e. matrices elaborating on the linkages between SU-tables and institutional sector accounts; and
- satellite accounts, i.e. accounts linking the 1993 SNA with specific fields of enquiry.

INTERPRETIVE SUMMARY

Background

Statistics South Africa (Stats SA) further implemented the 1993 System of National Accounts (1993 SNA) in conjunction with rebasing and benchmarking gross domestic product (GDP) estimates which were published in Statistical Release P0441 Gross Domestic Product, Revised Annual estimates 2002-2008 and Third quarter 2009 released on 24 November 2009. The result of the benchmark process was to develop an integrated, coherent set of statistics that will inform users on the dynamics of the economy.

This statistical release contains revised estimates of the gross domestic product (GDP) for the period 2002 to 2008. It is calculated from all three approaches of calculating GDP.

Major revisions of the national accounts were necessary due to -

- The change of the base year for the estimates at constant prices;
- The availability of new sources of information such as Annual financial Statistics (AFS) and Large Sample Surveys (LSS).
- Improvements in methodology; and
- Revisions of basic economic datasets as part of Stats SA's economic improvement strategy

In accordance with international best practice, an update of the base year accompanied by some revisions of the GDP estimates have been taking place regularly every five years in South Africa.

The 1993 SNA requires countries to compile supply and use tables (SU-tables) as they form an integral part of the 1993 SNA. According to the 1993 SNA, the annual estimates of gross value added and its components, as well as output, intermediate consumption expenditure, final consumption expenditure and GDP should all have their origin in annual SU-tables. This is because these tables have been developed to check the accuracy and consistency of the economic data contained in the national accounts.

The SU-tables are intended to include all the transactions in goods and services in an economy for a specific year, e.g. 2005, in a matrix format. They allow for close examination of the consistency of the national accounts by linking and integrating the various components within a single framework.

As an extension of the implementation of the 1993 SNA, Stats SA compiled the first official SU-tables for South Africa for the 1993-reference and published it in December 1999. Stats SA have been publishing SU-tables annually as from the 1998-reference year. This will ensure an extended time-series of the SU-tables and also assist in analysing and evaluating the performance of the economy over time.

Integration with national accounts The SU-tables was used to estimate the annual GDP estimates. The 2005 SU-tables are therefore reconciled with the national accounts estimates of GDP by activity and the expenditure on GDP.

Interpretation The SU-tables serve as a co-ordinating framework to ensure the numerical consistency and accuracy of data obtained from different sources (i.e. industrial surveys, households surveys, investment surveys and trade statistics). The SU-tables are also important in analysing and evaluating the performance of an economy over time.

However, as this latter function is dependent on the availability of an extended time-series of SU-tables, the analysis is limited to a brief comparison of some of the more important findings regarding 2002, 2003, 2004 and 2005.

Components of gross value added by industry

Gross value added at basic prices is defined as output valued at basic prices less intermediate consumption valued at purchasers' prices. Table A shows the components of gross value added at basic prices by industry for 2002, 2003, 2004 and 2005. An analysis of the percentage contribution of the components of gross value added to total gross value added at basic prices for different industries shows that in certain industries the compensation of employees is the largest contributor to the total gross value added by the specific industry (e.g. construction, general government and other personal services). In other industries, the operating surplus is the largest contributor to the total gross value added by the specific industry (e.g. agriculture, mining, electricity, gas and water etc.).

In 2005, the compensation of employees accounted for 87,2% of the total gross value added in the general and government services (compared with the 86,3% in 2002, 86,8% in 2003, and 87,3% in 2004). The construction sector experienced a decrease in compensation of employees from 50,5% in 2005 compared with 57,0% in 2002, 57,5% in 2003 and 53,2% in 2004. For the transport, storage and communication sector, the decrease in compensation of employee accounted for 36,2% in 2005 compared with 37,3% in 2002, 37,1% in 2003 and 36,9 % in 2004. The gross operating surplus accounted for 67,2 % in 2005 of the total gross value added in the agriculture, hunting, forestry and fishing industry (compared with the 66,7% in 2002, 65,9% in 2003 and 66,9% in 2004) (table A).

The percentage contribution of taxes less subsidies on production is negligible in all cases.

Table A – Percentage contribution of components of gross value added to total gross value added at basic prices according to industry: 2002, 2003, 2004 and 2005

Industry	Year	Compensation of employees	Gross operating surplus / Mixed income	Taxes less subsidies on production	Total gross value added
Agriculture, hunting, forestry and fishing	2002	33,0	66,7	0,3	100,0
	2003	33,9	65,9	0,2	100,0

	2004	50.1	47.7	2.1	100,0
	2005	49.9	48.1	2.0	100,0

Output of industries according to type of input

Output consists of those goods or services that are produced within an establishment that become available for use outside the establishment, plus any goods and services produced for own final use.

Table B reflects a breakdown of the output of the primary, secondary and tertiary industries according to type of input in 2002, 2003, 2004 and 2005. It is interesting to note that in the case of the primary and tertiary industries, gross value added constituted more than 50% of the output in these years, while in the secondary industry gross value added constituted just over 25% of its output. Furthermore, it is evident that the secondary industry is the largest user of secondary products, which serve as intermediate inputs.

Table B – Output of industries according to type of input: 2002, 2003, 2004 and 2005

Input	Year	Output of Primary industry		Output of Secondary industry		Output of Tertiary industry	
		R million	% Contribution	R million	% Contribution	R million	% Contribution
Primary product	2002	5 861	2,3	154 346	15,3	2 252	0,2
	2003	5 629	2,3	156 651	14,5	2 428	0,2
	2004	6 174	2,5	172 857	15,0	3 175	0,2

	2005	55 510	20,3	215 158	17,3	557 384	32,2
Gross value added	2002	136 962	53,3	254 828	25,2	673 908	53,0
	2003	125 414	52,1	280 217	25,9	749 519	52,9
	2004	130 688	52,0	306 182	26,5	833 730	53,7
	2005	143 394	52,3	330 669	26,6	927 004	53,5
Total	2002	256 890	100,0	1 009 667	100,0	1 271 087	100,0
	2003	240 590	100,0	1 080 455	100,0	1 416 069	100,0
	2004	251 466	100,0	1 155 145	100,0	1 553 655	100,0
	2005	274 019	100,0	1 242 088	100,0	1 732 044	100,0

Final demand

Different components of final demand are distinguished in the SU-tables. The supply table shows the imports of goods and services and the adjustments to the imports for the difference between cost of insurance and freight (c.i.f.) and free on board (f.o.b.). The use table shows final consumption expenditure by households and the general government as well as gross capital formation (gross fixed capital formation and changes in inventories) and exports of goods and services.

The composition of final demand in 2005 shows that household consumption expenditure accounted for 63,06% of final demand, general government consumption expenditure 19,46% and gross capital formation 17,96%.

The supply of products at basic prices

Basic prices are the preferred method of valuing output in the 1993 SNA. The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any tax payable *plus* any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any transport charges invoiced separately by the producer. The total supply of products (e.g. agriculture-, hunting-, forestry- and fishing products) at basic prices can be divided according to its origin, i.e. whether the products are domestically produced or imported.

Table C – Supply of products at basic prices according to origin: 2002, 2003, 2004 and 2005

Type of product	Year	Domestic produced goods		Imports	
		R million	% contribution	R million	% contribution
Agriculture, hunting, forestry and fishing	2002	86 393	3,4	4 320	1,3
	2003	84 904	3,1	4 050	1,2
	2004	86 264	2,9	4 702	1,2
	2005	85 162	2,6	6 100	1,4

	2003			-20 304	-6,2
	2004			-23 845	-6,3
	2005			-27 819	-6,4
Purchases by residents	2002			19 601	5,8
	2003			18 819	5,8
	2004			19 887	5,3
	2005			22 097	5,1
Total supply of products	2002	2 537 634	100,0	340 638	100,0
	2003	2 737 113	100,0	325 037	100,0
	2004	2 960 266	100,0	378 177	100,0
	2005	3 248 151	100,0	437 559	100,0

Table C shows to what extent South Africa's total supply of products were dependent on domestically produced goods and imports in 2002, 2003, 2004 and 2005 in meeting domestic demand.

The most important domestically produced goods for 2002, 2003, 2004 and 2005 were manufactured goods which accounted for R798 056 million (31,4%)

in 2002, R841 709 million (30,8%) in 2003, R898 462 million (30,4%) in 2004 and R957 373 million (29,5%) in 2005; followed by trade, transport and distribution which accounted for R435 098 million (17,1%) in 2002, R474 872 million (17,3%) in 2003, R515 375 million (17,4%) in 2004 and R562 999 million (17,3%) in 2005; and community, social and personal services of R386 705 million (15,2%) in 2002, R438 092 million (16,0%) in 2003, R475 349 million (16,1%) in 2004 and R527 403 million (16,2%) in 2005.

Imported goods in 2005 were predominantly manufactured goods with 71,1%, compared with 68,8% in 2002, 69,2% in 2003 and 70,5% in 2004; followed by ores, minerals electricity and water with 11,1%, compared with 12,3% in 2002, 12,3% in 2003 and 11,7% in 2004.

Use of products at purchasers' prices

The 1993 SNA recommends that intermediate and final consumption expenditure be valued at purchasers' prices. The purchaser's price is the amount paid by the purchaser, excluding any deductible value added tax (VAT) or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Table D (p. 8) shows the uses of products at purchasers' prices according to destination for 2002, 2003, 2004 and 2005, namely, intermediate consumption expenditure and final consumption expenditure, including exports. In comparing total final consumption expenditure for 2005 with 2002, 2003 and 2004, it is evident that expenditure on (use of) certain products increased.

- Metal, machinery and equipment (19,0% in 2005 compared with the 18,5% in 2002, 18,4% in 2003 and 18,7% in 2004);
- Construction (5,0% in 2005 compared with the 4,1% in 2002, 4,9% in 2003 and 4,8% in 2004);
- Financial real estate and leasing (10,2% in 2005 compared with the 9,1% in 2002, 9,4% in 2003, and 10,0% in 2004);
- Business and production services (3,4% in 2005 compared with the 3,1% in 2002, 3,3% in 2003); and
- Community, social and personal services (22,2% in 2005 compared with the 21,6% in 2002)

If total intermediate consumption expenditure for 2005 is compared with total intermediate consumption expenditure for 2002, increases were recorded for the following products.

- Trade, transport and distribution (9,7% in 2005 compared with the 9,4% in 2002 and 2003 respectively and 9,5% in 2004);
- Financial, real estate and leasing services (13,4% in 2005 compared with the 11,7% in 2002, 12,6% in 2003 and 12,8% in 2004);
- Business and production services (15,9% in 2005 compared with the 15,6% in 2002, 15,7% in 2003 and 2004 respectively); and
- Community, social and personal services (5,8% in 2005 compared with the 5,1% in 2002);

Table D – Use of products at purchasers' prices according to destination: 2002, 2003, 2004, 2005

Type of product	Year	Total final consumption expenditure ^{1/}		Total intermediate consumption expenditure	
		R million	% contribution	R million	% contribution
Agriculture, hunting, forestry and fishing	2002	47 327	3,1	53 002	3,6
	2003	46 205	2,9	53 392	3,4
	2004	46 187	2,6	56 822	3,4
	2005	48 247	2,4	56 347	3,1
Ores, minerals, electricity and water	2002	114 678	7,6	109 457	7,4
	2003	99 665	6,2	111 316	7,0
	2004	101 552	5,7	125 384	7,4
	2005	120 878	6,0	134 983	7,3
Food, beverages, textile, apparel	2002	217 928	14,4	84 667	5,8

^{1/} Total final consumption expenditure = Households consumption expenditure + General government consumption expenditure + Fixed capital formation + Changes in inventories + Exports

METHODOLOGICAL NOTES

Background to the 1993 SNA and SU-tables

Although the 2008 SNA has been adopted as an international standard, it is not yet implemented in South-Africa. This publication and figures of national accounts are therefore still done according to recommendations of the SNA 1993. The latest results on benchmark and rebasing of GDP were published in Statistical Release P0441 *Gross Domestic Product, Revised estimates 2002-2008 and Third quarter 2009* released on 24 November 2009. The publication *Final supply and use tables, 2005* is an extension of the implementation of the 1993 SNA. The first official SU-tables for the 1993 reference year were published in 1999. Stat SA has been publishing SU-tables annually as from the 1998 reference year. This will ensure an extended time-series of the SU-tables and also assist in analysing and evaluating the performance of the economy over time.

Apart from many new aspects, the 1993 SNA includes a consistent and integrated set of SU-tables which - among other features - provide a detailed analysis of the process of production, the use of goods and services (products) and the income generated in that production. In other words, its role in the 1993 SNA is primarily related to the production account and to the goods and services and generation of income accounts. This ensures that the information contained in the SU-tables and the other components of the national accounts, such as the GDP and the expenditure on the GDP, is reconciled.

As the role of SU-tables is primarily related to the goods and services (table E), production (table F) and generation of income (table G) accounts, these accounts are briefly discussed before attention is given to the structure of the SU-tables.

Goods and services account

The goods and services account (table E) shows, for the total economy, how the total amount of product available (resources) is equal to the total amount used. Resources are shown on the left-hand side and uses are shown on the right-hand side.

Table E – Goods and services account: 2005

Resources	R million	Uses	R million
Output	3 248 151	Intermediate consumption	1 847 084
Taxes on products	175 667	Final consumption expenditure	1 296 505
Subsidies on products	-5 652	Private consumption expenditure	990 773
Imports of goods and services	437 559	Government consumption expenditure	305 732
		Gross capital formation	282 129
		Gross fixed capital formation	263 753
		Changes in inventories	18 376
		Exports of goods and services	430 170
		Residual item	-163
Total resources	3 855 725	Total uses	3 855 725

Production account The production account (table F) emphasises the concept of GDP or value added as one of the main balancing items in the 1993 SNA. The 1993 SNA recommends the calculation of GDP for the entire economy and the calculation of value added for the various industries. The GDP is essentially a production measure as it is obtained through the sum of the gross values added of all resident institutional units, in their capacities as producers, plus the values of any taxes, *less* subsidies, on production or imports not already included in the values of the outputs and values added by resident producers.

Value added measures the value created by production and may be calculated either before (gross) or after (net) deducting the consumption of fixed capital on the fixed assets used. Gross value added is defined as the value of output less the value of intermediate consumption. Gross/net value added is the balancing item in the production account for an institutional unit, sector, establishment or industry, while gross/net domestic product is the balancing item in the production accounts for the total economy.

It is important to note that value added does not cover all transactions linked to the production process, but only to the result of production, i.e. output and the utilisation of goods and services when producing this output, i.e. intermediate consumption. In other words it includes output as a resource (see right-hand side of the production account) and intermediate consumption as a use (see left-hand side of production account). As the consumption of fixed capital is not shown separately, the resulting balancing item is *gross* domestic product.

Table F – Production account: 2005

Uses	R million	Resources	R million
Intermediate consumption	1 847 084	Output	3 248 151
		Taxes on products	175 667
		Subsidies on products	-5 652
<i>Gross domestic product</i>	<i>1 571 082</i>		

Source: Stats SA: Statistical Release P0441 *Gross Domestic Product: Annual estimates 2002-2008, Third quarter 2009*, 24 November 2009

Generation of income account

The generation of income account (table G) records distributive transactions resulting from the production process. Distributive transactions consist of transactions by which the value added generated by production is distributed to labour, capital and government, and transactions involving the redistribution of income and wealth (taxes on income and other transfers).

Thus, the resources include gross domestic product and the uses refer to compensation of employees as well as taxes less subsidies on production and imports. The balancing item is gross operating surplus/mixed income. The mixed income refers to the balancing item in the generation of income account for the household sector. The reason is that the surplus generated by unincorporated household enterprises includes both remuneration for the labour of the owner as well as a return to the entrepreneurship and capital employed.

Table G – Generation of income account: 2005

Uses	R million	Resources	R million
Compensation of employees	699 018	Gross domestic product	1 571 082
Taxes on production and imports	208 594		
Taxes on products	175 667		
Other taxes on production	32 927		
Subsidies	-10 081		
Subsidies on products	-5 652		
Other subsidies on production	-4 429		
<i>Gross operating surplus/mixed income</i>	<i>673 551</i>

Concepts and definitions applicable to SU-tables

The 1993 SNA clarifies, inter alia, the concepts and definitions used for the valuation of output of goods and services, intermediate consumption, and value added. The concepts and definitions applicable to the SU-tables are briefly discussed below.

Output of goods and services

Output consists only of those goods and services that are produced within an establishment and that become available for use outside that establishment and for own final use in that establishment. Output may be valued in various ways. The 1993 SNA prescribes three ways in which output of goods and services may be measured, namely at basic prices, producers' prices or purchasers' prices.

- The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any tax payable (e.g. excise duties and value added tax (VAT)) *plus* any subsidy receivable on that unit as a consequence of its production or sale. Basic prices *exclude* any transport charges invoiced separately by the producer.
- Producers' price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any VAT, or similar deductible tax, invoiced to the purchaser. It *excludes* any transport charges invoiced separately by the producer.
- Purchasers' price is the amount paid by the purchaser, *excluding* any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good *includes* any transport charges paid separately by the purchaser to take delivery at the required time and place.

The relationship between the above-mentioned concepts can be expressed as follows:

	Output at basic prices
<i>plus</i>	taxes on products (excluding VAT)
<i>less</i>	subsidies on products
=	Output at producers' prices
<i>plus</i>	trade and transport margins
<i>plus</i>	non-deductible VAT
=	Output at purchasers' prices

Basic prices are the preferred method of valuing output of goods and services produced for the market, especially when a system of VAT is in operation.

Intermediate consumption

With regard to the valuation of intermediate consumption, i.e. expenditure by enterprises on goods and services consumed as inputs in the production process, the 1993 SNA recommends that it should be valued at purchasers' price. Intermediate inputs purchased and/or transferred from other establishments belonging to the same enterprise, should be valued at the same prices as used to value them as outputs of those establishments, plus any additional transport charges not included in the output values.

Gross value added

The 1993 SNA recommends that gross value added by the various industries be valued at basic prices, both at current and constant prices. It is important to note that gross value added at basic prices excludes any taxes payable on products and includes any subsidies receivable on products. As the basic price measures the amount retained by the producer it is, therefore, the price most relevant for the producer's decision taking. Gross value added at basic prices is also the measure preferred and adopted by Stats SA.

Previously South Africa's national accounts measured value added at factor cost. This is no longer the case. In this regard it should be noted that although the 1993 SNA acknowledges that gross value added at factor cost can still be computed, it does, however, not recommend it as a measure of value added due to the non-existence of observable prices such that output minus intermediate consumption equals gross value added. Factor cost is a concept of income rather than production. The expression "at factor cost" means that value added is valued at the cost of factors of production (e.g. capital, labour, land and entrepreneurship). Production or output valued at factor cost excludes taxes on production and imports (e.g. VAT, excise duties, business licenses and registration fees) but includes other subsidies on production.

In order to derive the GDP at market prices, taxes less subsidies on products must be added to total gross value added at basic prices. It should be noted that GDP at market prices is a measure, which is only applicable to the total economy.

The classification and terminology of taxes

In accordance with the 1993 SNA recommendations, South Africa has adopted the revised classification and terminology of taxes. The 1968 SNA term “indirect taxes” has been replaced by the term “taxes on production and imports” and the 1968 SNA term “direct taxes” has been changed to “current taxes on income and wealth”. Furthermore, the distinction between “commodity taxes” and “other indirect taxes and imports” has been replaced by the terms “taxes on products” and “other taxes on production”.

Taxes on production and imports include taxes on products and other taxes on production. Taxes on products consist of taxes payable on goods and services when they are produced, delivered, sold or otherwise disposed of by their producers. Furthermore, they are payable per unit of a good or service produced. Important examples of taxes on products are excise and import duties and VAT. Other taxes on production consist of taxes on the ownership of land, buildings or other assets used in production or on labour employed, etc. Important examples of other taxes on production are taxes on payroll or work force, business or professional licenses, etc.

Current taxes on income and wealth cover all compulsory payments levied by government on the income and wealth of institutional units. These taxes include taxes on individual or household income, taxes on the income or profits of corporations, etc.

Financial Services Indirectly Measured (FSIM)

Banks and other financial institutions provide a variety of services. Those that are specifically charged for include currency exchange, handling of cheques, etc., and the corresponding revenues form part of the institutions’ output. An additional, and very significant part of their income comes from charging higher interest rates to borrowers and paying lower interest rates to depositors than they would need to if they charged explicitly for all their services. This “hidden” charge (known as imputed bank service charge in the 1968 SNA) is called Financial Services Indirectly Measured (FSIM) in the 1993 SNA. The total value of FSIM is measured in the 1993 SNA as the total property income receivable by financial intermediaries minus their total interest payable, excluding the value of any property income receivable from the investment of their own funds, as such; income does not arise from financial intermediation.

The total value of financial intermediation services was previously recorded separately as a negative item in the system of national accounts. According to the 1993 SNA, the total output should be allocated among the various recipient industries or users e.g. households of the services for which no explicit charges are made.

Trade margins

The output of wholesalers and retailers is measured by the value of the trade margins realised on the goods they sell i.e. the difference between the sale value of products sold and the cost of purchasing these products. The reason for measuring the output of the wholesale and retail trade by the trade margins is because the productive activity associated with distribution is construed to be the provision of services for displaying the goods in an informative and attractive way. Included in the trade margins are estimates regarding the

informal sector, i.e. goods sold by stalls, street hawkers and other itinerant merchants.

Transport margins

Transport margins constitute part of the output of transport of goods. Basically, there are two methods of treating transport margins in a SU-table.

When transport is arranged in such a way that the purchaser has to pay separately for the transport costs, in other words if the transport costs are billed separately, these costs are identified as transport margins. This implies that customers not only buy the goods, but also transport services from producers.

If the producer transports the goods, or arranges for them to be transported without extra cost to the purchaser, transportation will appear as intermediate consumption to the producer, and at the same time it will be included in the basic price.

The output of passenger transport is not part of transport margins.

Secondary and ancillary production

Establishments often produce products that are not typical of the industries in which they are classified for statistical censuses or surveys. According to the standard industrial classification (SIC) used by Stats SA, the establishment is the statistical unit according to which all economic activities are classified. A business at a particular address is classified in its entirety according to its principal activity in a certain industry, and both principal and secondary products of that establishment then form part of the output of the particular industry. The major output of such a business, which determines its classification, is called its principal output, and its other outputs, typically produced by another industry, are called its secondary output.

From the above, it is clear that a secondary activity may be defined as an activity carried out within an establishment in addition to the principal activity and whose output, like that of the principal activity, must be suitable for delivery outside the establishment. In the supply table secondary products are shown as *off diagonal entries*. The value added of a secondary activity must be less than that of the principal activity.

Ancillary products, in contrast to principal and secondary products, are not intended for use outside the establishment and are also not explicitly recognised and recorded separately in the SU-tables. They are merely supporting activities undertaken within the establishment for purposes of creating the necessary conditions within which the principal and secondary activities can take place.

The following kinds of activities are typical examples of ancillary products -

- keeping records or files;
- purchasing and storing of materials or equipment;
- cleaning and maintenance of buildings;
- provision of security; and
- reparation and servicing activities.

Gross capital formation

The 1993 SNA recommends that gross capital formation be measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables. Due to data constraints, it is not possible to include any estimates for the acquisition less disposals of valuables in the SU-tables.

Data constraints also resulted in two further recommendations of the 1993 SNA relating to gross capital formation not being implemented. These are the treatments of expenditure on -

- mineral exploration;
- computer software;

User should keep the SNA93 recommendation pertaining to expenditure by the defence force on fixed assets that could be used for production purposes by both military and civilian users in mind. In principle, Expenditure on, inter alia, military hospitals and other military buildings were treated as gross fixed capital formation

Import data

Import data is adjusted for the difference between cost of insurance and freight (c.i.f.) and free on board (f.o.b.). The adjustment is necessitated by the 1993 SNA recommendation to value imported commodities at c.i.f. prices, but total imports at f.o.b. prices. The difference between the f.o.b. price and the c.i.f. price represents the costs of transportation and insurance between the frontier of the exporting country and the frontier of the importing country.

Structure of SU-tables

The structure of the SU-tables is explained by means of an aggregated set of tables (tables H and I). In order to simplify references to these SU-tables, the columns of the supply table have been numbered SC and the rows of the supply table have been numbered SR, while the columns of the use table have been numbered UC and the rows of the use table have been numbered UR. The intersection of a row and a column is denoted by a colon separating the two applicable numbers e.g. SC1:SR1. Furthermore, the economy is divided into three industries, primary, secondary and tertiary, as shown in columns SC5 to SC7 and UC4 to UC6. The sum of these three industries is found in columns SC8 and UC7.

Supply table

The supply table (table H) shows the origin of the resources of goods and services, depicting products in rows (SR) and industries in columns (SC). In the rows, the various types of products are presented according to a product classification (table J). An additional row is added for the adjustment of direct purchases by South African residents abroad. In the columns, information on the output of each industry according to an industrial classification (table M and table N), imports, taxes less subsidies on products and trade and transport margins are shown. Furthermore, in the supply table, goods and services produced in the economy are measured at basic prices. Basic price is the preferred method of valuing output in the 1993 SNA. The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any tax payable *plus* any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any

transport charges invoiced separately by the producer. The c.i.f./f.o.b. adjustment to import data is shown in column SC10 and row SR4.

Use table

The use table (table I) shows the uses of goods and services and supplies information on the cost structures of the various industries. In the rows, the various types of products are presented according to a product classification (table K and L). Additional rows are added for the adjustment of direct purchases by South African residents abroad and direct purchases in the domestic market by non South Africans residents. The table is divided into three different sections, each with its own characteristics.

The *first section* shows the goods and services used as intermediate consumption at purchasers' prices by industry in columns (UC4-UC6)) and by product in rows (UR1-UR5). The total row (UR6) shows intermediate consumption by industries at purchasers' prices.

The *second section* shows the components of final demand (column UC9), namely, exports, households consumption expenditure, general government consumption expenditure, fixed capital formation, changes in inventories and the residual item at purchasers prices.

The *third section* elaborates on the production costs of producers other than intermediate consumption expenditure (columns UC2-UC7 and row UR7) namely, compensation of employees, taxes less subsidies on production and imports, consumption of fixed capital and net operating surplus/mixed income.

The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Uses of SU-tables

The SU-tables, often regarded as the cornerstone of the 1993 SNA, have both statistical and analytical functions.

As a statistical tool they provide a co-ordinating framework for checking the consistency of economic statistics on flows of goods and services obtained from quite different kinds of statistical sources, i.e. industrial surveys, household surveys, investment surveys, foreign trade statistics. Furthermore, the SU-tables serve as a basis for calculating the economic data contained in the national accounts and to detect weaknesses in the economic data.

As an analytical tool, the tables are conveniently integrated into macroeconomic models in order to analyse the link and interaction between final demand and industrial output levels. This type of analysis, which is also known as impact analysis, enables users at universities and research institutions to use the tables for sophisticated analysis, including market and productivity analysis.

Table H - Framework of the supply of products at basic prices: 2005 (R million)

Column no.	SC1	SC2	SC3	SC4	SC5	SC6	SC7	SC8	SC9	SC10	
	(SC2+SC3+ SC4)			(SC8+ SC9+ SC10)	Output of industries			(SC5+ SC6+ SC7)			
Row no.	Supply of products	Total supply at purchasers' prices	Taxes less subsidies on products	Trade and transport margins	Total supply at basic prices	Primary industry	Secondary industry	Tertiary industry	Total industry	Imports	c.i.f./ f.o.b. adjustment on imports
SR1	Primary products	360 455	8 594	16 955	334 906	265 907	14 435	0	280 342	54 564

Table I - Framework of the use of products at purchasers' prices: 2005 (R million)

Column no.		UC1 (UC7+UC9)	UC2	UC3	UC4	UC5	UC6	UC7 (UC4+ UC5+ UC6)	UC8 (UC2+ UC3+ UC7)	UC9
Row no.	Supply of products	Total supply at purchasers’ prices	Taxes on products	Subsidies on products	Primary industry	Secondary industry	Tertiary industry	Total industry	Total economy	Compo- nents of final demand
UR1	Primary products	360 455			6 331	181 738	3 261	191 030		169 125
UR2	Secondary products	1 789 661			68 784	514 523	244 395	827 702		961 959
UR3	Tertiary products	1 683 512			55 510	215 158	557 384	828 052		855 460
UR4	Direct purchases residents	22 097								22 097
UR5	Direct purchases non residents	0								0
UR6	Total uses at purchasers’ prices	3 855 725			130 625	911 419	805 040	1 847 084		2 008 641
UR7	Gross value added/ GDP		170 015		143 394	330 669	927 004	1 401 067	1 571 082	
UR8	Total output at basic prices				274 019	1 242 088	1 732 044	3 248 151		

The SU-tables have, in addition to their major statistical and analytical functions mentioned above, many additional uses. The following are some examples of the extended use of supply and use tables:

- Derivation of GDP.
- Other derivations.
- Symmetric input-output tables.
- Social accounting matrices (SAMs).
- Satellite accounts.

Derivation of GDP

The production, income and expenditure based components of GDP at current market prices can all be derived from the SU-tables (tables H and I).

The *production approach* derives GDP at market prices by deducting intermediate consumption expenditure (uses) at purchasers' prices from total output at basic prices after making provision for taxes and subsidies on products as well as trade and transport margins. The corresponding entries for 2005 in tables H and I are:

Output at basic prices	SC8:SR6	R 3 248 151
	UC7:UR8	
<i>plus</i> Taxes less subsidies on products	SC2:SR6	R 170 015
<i>plus</i> Trade and transport margins	SC3:SR6	R 0
<i>less</i> Intermediate consumption		
(at purchasers' prices)	UC7:UR6	<u>R 1 847 084</u>
= GDP at market prices	UC8:UR7	<u>R 1 571 082</u>

The *income approach* to estimate the GDP at market prices entails summing all the components of value added i.e. remuneration of employees and gross operating surplus after making provision for taxes and subsidies on products. In table I it is shown as column UC8.

GDP at market prices	UC8:UR7	R 1 571 082
----------------------	---------	-------------

The *expenditure approach* to estimate the GDP at market prices entails the summation of the components of final demand i.e. household consumption expenditure, general government consumption expenditure, fixed capital formation, change in the value of inventories and exports, in the use table (table I) and subtracting imports as obtained from the supply table (table H):

Components of final demand	UC9:UR6	R 2 008 641
<i>less</i> Imports	SC9:SR6	<u>R 437 559</u>
= GDP at market prices	UC8:UR7	<u>R 1 571 082</u>

Other derivations

Apart from deriving the GDP according to the various approaches, a number of different valuations regarding goods and services, output, etc., can also be deduced from SU-tables as is illustrated in tables E and F. The columns on the left of the SU-tables (SC1 and UC1) show the total supply of goods and services at purchasers' prices i.e. including taxes less subsidies on products and trade and transport margins. Total supply of goods and services at basic prices is shown in column SC4. The columns for trade and transport margins (SC3) and taxes less subsidies on products (SC2+UC2+UC3) are used to derive total supply of products at purchasers' prices from the valuation at basic prices.

Column SC9 refers to imported goods and services. The c.i.f./f.o.b. adjustment to imports is shown in column SC10 and row SR4. The GDP at market prices is shown in column UC8, while the components of final demand (final consumption expenditure, gross capital formation, exports and the residual item), also valued at market prices, are shown in column UC9.

The products available in the economy are classified in rows SR1 to SR3 and UR1 to UR3. For each product, total supply and total use in purchasers' prices are equal. The rows SR5 and UR4 refer to direct purchases by South African residents abroad, which are treated as both imports and household expenditures. The expenditure by non-residents in the domestic market is shown in UR5. As it is included in both the exports (as a positive entry) and final consumption expenditure by households (as a negative entry), the net value in UC9 is nil.

The total output at basic prices for the different industries is shown in rows SR6 and UR8. Row UR6 includes total uses at purchasers' prices and UR7 shows gross value added for all industries and GDP at market prices for the total economy.

The off-diagonal production by a particular industry or group of industries can also be easily deduced from a supply and use table. For example, the intersection SC6:SR1 shows that the secondary industries produced R14 435 million of primary products. Furthermore, the secondary industry produced R133 492 million of tertiary products (SC6:SR3). The value of the secondary industries' principal output (secondary products SC6:SR2) was R1 094 161 million. The negative value (R279 693 million) in SC3:SR3 reflects the total margins that are deducted from tertiary products as they are distributed throughout SC3 to convert the supply at basic prices to the supply at purchasers' prices.

Details regarding intermediate and final consumption can also be directly obtained from a SU-table, for example the first row of the use table (UR1) shows that primary products were used as intermediate consumption expenditure by the primary industry (R6 331 million), secondary industry (R181 738 million) and tertiary industry (R3 261 million) and as final consumption expenditure (R169 125 million).

Input-output tables

The SU-tables form the basis for the estimation of input-output tables, both at current and at constant prices. From a statistical point of view, input-output tables serve many needs, including a framework for -

- basic data compilation;
- weighting and calculation of index numbers;
- accessing quality and completeness of data;
- developing interrelated price and volume measures; and
- consistency checking.

Symmetric input-output tables can be derived from SU-tables and used for various kinds of analytical purposes, including the analysis of -

- production;
- structure of demand;
- export ratios;
- employment;
- impact studies;
- prices and costs;
- required imports;
- investment and capital;
- exports,
- energy;
- the environment; and
- sensitivity analysis through the construction of (dynamic) output modelling.

Social Accounting Matrices (SAMs)

A SAM elaborates on the linkages between SU-tables and institutional sector accounts. It is a presentation of the SNA in matrix terms that incorporates whatever degree of detail that might be of special interest. To date, builders of SAMs have exploited the available flexibility to highlight special interests and concerns, display the various interconnections, disaggregate the households sector; show the link between income generation and consumption, etc. The power of a SAM, as well as the 1993 SNA, comes from choosing the appropriate type of disaggregation to study the topic of interest. In addition to a flexible application and the inclusion of various components, a SAM may incorporate more extensive adjustments, which are of a satellite accounting nature, in order to satisfy specific analytical purposes.

Satellite accounts

As in the case of SAM, the links to the central framework, including the supply and use framework is of paramount importance in constructing satellite accounts. In some cases, working with the central framework of the 1993 SNA, even in a flexible way, is not sufficient. Even though conceptually consistent,

the central framework may be overburdened with detail. Moreover, some requirements may conflict with the central conceptual framework and its architecture.

In certain types of analysis, the basic intention is not to use alternative economic concepts, but simply to focus on a specific field or aspect of economic and social life in the context of national accounts. The intent is to make apparent and to describe in more depth aspects that are hidden in the accounts of the framework or surface only in a limited number of points, e.g. tourism. Tourism as such is not a normal industry and cannot be classified separately as e.g. the manufacturing industry. Various aspects of tourism may appear in detailed classifications of activities, products and purposes. However, specific tourism transactions and purposes appear separately only in a few cases. In order to measure and describe tourism in a national accounts framework, use must be made of satellite accounting. This approach allows for the adaptation of the various classifications and measurement of additional aggregates, such as national expenditure in tourism.

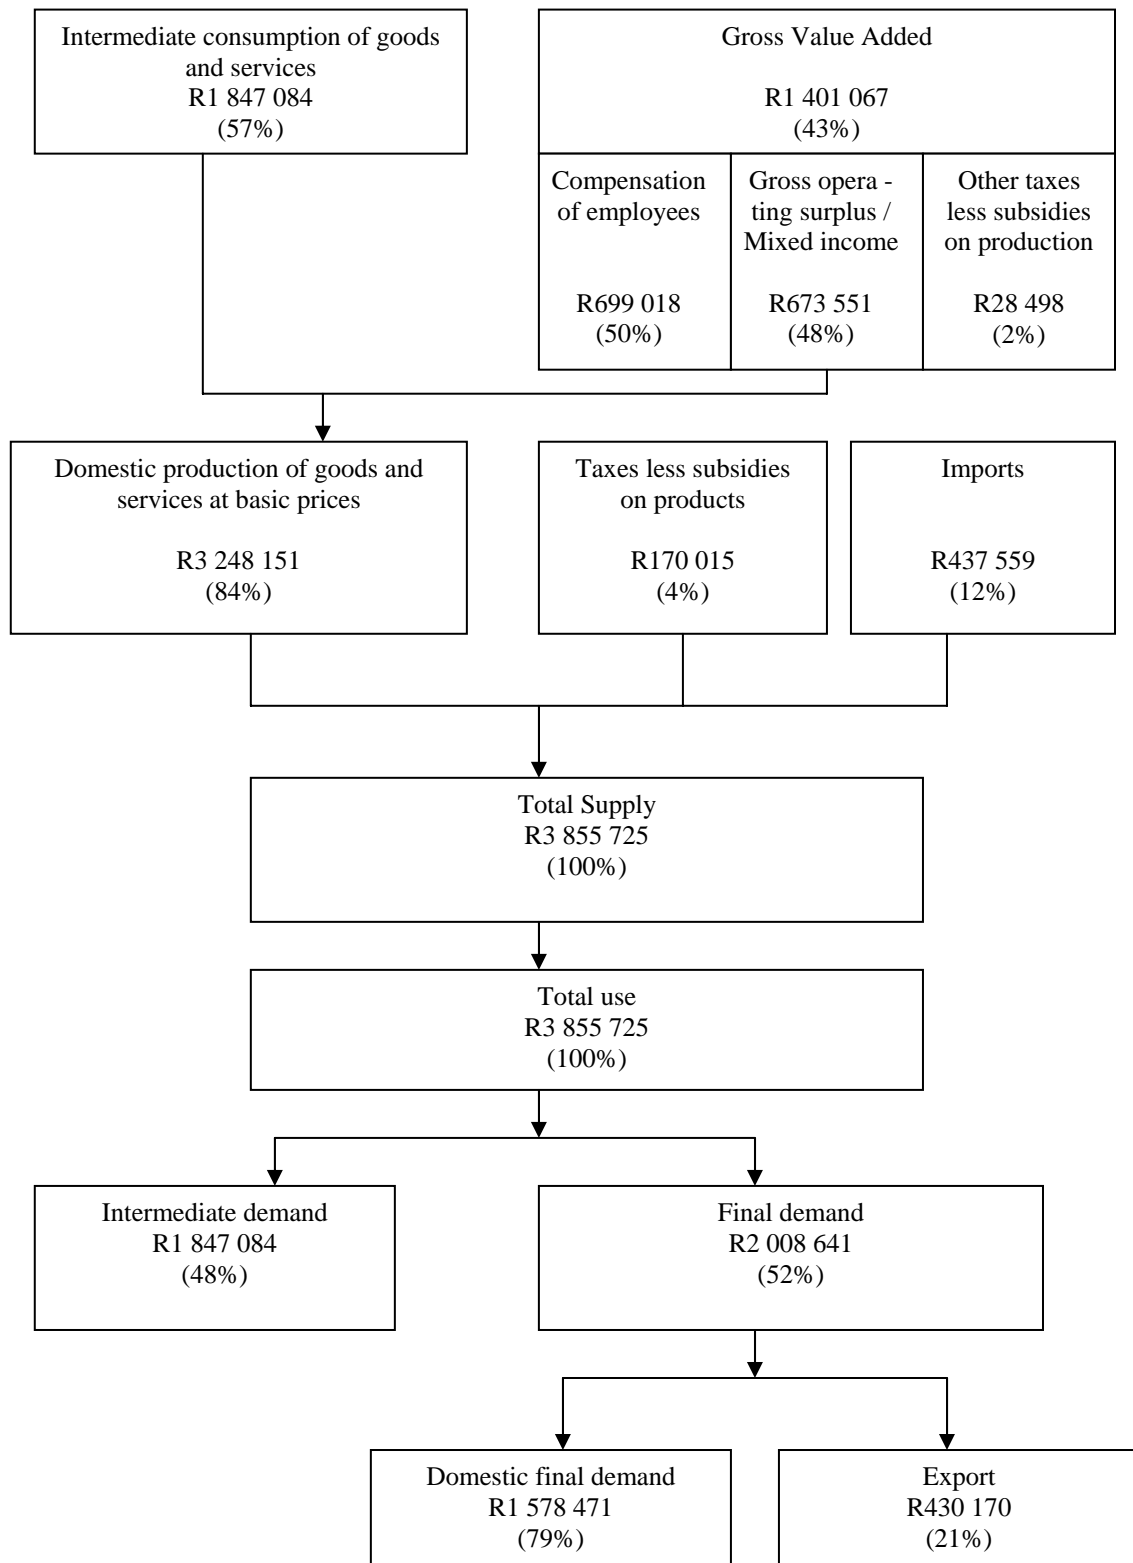

In other types of analysis, alternative concepts are emphasised, such as the enlargement of the production boundary through the inclusion of domestic services by members of the household. In these approaches, the economic process itself is depicted differently, and complementary or alternative aggregates are calculated.

The analysis of a number of important fields such as the environment may benefit by building a framework to accommodate elements included in the central accounts, explicitly or implicitly, plus complementary elements, either monetary or in physical quantities, and possibly alternative concepts and presentations.

Alternative view

As an alternative, the flows of goods and services in the economy, as well as macro-economic concepts associated with the flows, can be explained through using a diagram (figure 1). This diagram is based on the principle that total supply = total use (demand) in the economy. It further shows that total supply (R3 855 725 million) can be derived by adding domestic production at basic prices (R3 248 151 million), taxes less subsidies on products (R170 015 million) and imports (R437 559 million). Furthermore, domestic production at basic prices (R3 248 151 million) is a combination of intermediate consumption of goods and services by all industries (R1 847 084 million) and gross value added, i.e. compensation of employees, gross operating surplus/mixed income and other taxes less subsidies on production (R1 401 067 million). The total use (R3 855 725 million) consists of final demand (R2 008 641 million) and intermediate demand (R1 847 084 million). The distribution of intermediate consumption and domestic final demand between goods and services is also shown.

Figure 1 – Flow of goods and services according to the 2005 supply and use tables (R million)

Balancing process The SU-tables were balanced through the application of the “commodity flow method”, where applicable. This is a method whereby the detailed supply of goods and services (whether imported or domestically produced) is allocated between various intermediate or final uses, including exports. It is reliant on detailed basic statistics and is most powerful when independent estimates are made for both the supply and the use of each commodity.

The first step in the balancing process of the 2005 SU-tables was to concentrate on balancing of information relating to specific industries. Production and generation of income accounts were compiled for each industry, ensuring that the calculation of GDP was consistent from both the production and the income approach.

Secondly the estimates/structures referring to components of final demand in the SU-tables were adjusted to comply with the level estimates published by the SARB. This allowed for the construction of a goods and services account, from which the difference (residual item) in the calculation of the GDP using the expenditure approach and the production/income approach could be estimated.

The third phase of the balancing process was to disaggregate the output and intermediate consumption items of the industrial production accounts across the detailed product categories. A similar process was followed for the components of final demand in the goods and services account, as well as the estimates of taxes and subsidies on products.

The fourth step was the calculation of trade and transport margins. This was required to adjust the valuation of the supply of products from basic to purchasers’ prices. After this, the residual item, as calculated in the second step, was allocated according to product classification in the use table.

During the fifth step, the initial residual (both positive and negative), between the supply and use of products at purchasers’ prices, was addressed through data confrontation and the use of the commodity flow approach. This entailed the verification of the quality of the data and the classification thereof, on both sides of the equation, for each product. After investigation of the data, judgmental decisions were required in order to adjust the total supply or use of products at purchasers’ prices.

THE TABLES

2005 SU-tables

Two tables are published in respect of 2005, namely -

- a supply table at basic prices (Table 1); and
- a use table at purchasers' prices (Table 2);

The tables provide a view of the final supply and use tables (SU-tables) for 2005 and were adjusted (through the allocation of the residual item across the components of final demand) to calculate the gross domestic product (GDP) by means of the income-, production- and expenditure approaches without a residual.

The supply of products

The simple question: "who produces what" is easily answered by referring to the supply table, where each row shows the distribution of output of each product (indicated by "P") by industry and where each column lists the distribution of output of each industry (indicated by "I") by product.

One finds for example, that in 2005 the grain mills industry (column I19, of the supply table) produced R13 179 million of grain mill products (row P16) while all domestic industries combined (row SP16 and column TI) produced R27 294 million of grain mill products. Thus, the grain mill industry accounted for 48,3% of the total domestic production of grain mill products in 2005.

The use of products

The use table displays the demand for various goods and services, which may be used as intermediate inputs (products that are purchased by an industry from other industries to produce its outputs) or for final consumption by households, government, etc.

The question of "who buys what" is answered in the use table. Elements in the row of the use table shows the use of a particular product by various industries as well as the use of this product by various categories of final demand.

In 2005, for example, all industries (column TI of the use table), used grain mill products (row P16) worth R8 156 million – the sum of row P16 across the columns (I1–I171) of the use table. Individual entries across row P16 represent individual uses by the industry indicated in the column.

This tabular presentation provides an analytical basis for understanding supply and demand for the products of any given industry. As Stats SA produces final SU-tables on an annual basis, users will be able to monitor changes over time.

Value added by industry

Generally speaking, the gross output of an industry consists of the value of the goods and services produced by that industry: the value of grain mill products produced by the grain mill industry; the value of cars and trucks produced by the motor vehicles manufacturing industry, etc. A brief reflection shows that, for example, the production of grain mill products requires agricultural products and other inputs. These goods and services are not the products of grain mills. Rather, they are produced by other industries and used by the grain mills as their inputs. Thus, a measure of the unduplicated production of an industry should exclude all intermediate inputs purchased from other industries.

The use table displays all the costs incurred in production by an industry: the goods and services used as intermediate inputs; returns to the factors of production (rows V2 and V7), namely, compensation of employees and

operating surplus/mixed income as well as taxes less subsidies (row V3). The latter entries, when combined, constitute “Value Added at Basic Prices” representing the contribution of the industry concerned to the total value of production of the economy.

Gross Domestic Product (GDP) for the total economy

In order to derive the measure of “Gross Domestic Product at Market Prices” for the total economy, net taxes on products, i.e. taxes on products less subsidies on products, should also be added to the measure of value added at basic prices as they are a part of the market price of goods and services. The net taxes in this case indicate that total subsidies on products (row V5) have been subtracted from total taxes on products (row V4). It should be noted that taxes are paid not only by the business sector but also by other sectors of the economy, which are covered in the final demand component of the use table in this publication.

The GDP at market prices as calculated above is called income-based GDP. In addition the supply and use tables also incorporate components of expenditure-based GDP i.e. household consumption expenditure (column F3 of the use table), government consumption expenditure (column F4 of the use table), fixed capital formation (column F5 of the use table), changes in inventories (column F6 of the use table) and net exports [exports (column F2 of the use table) less imports (column F1 of the supply table)].

Domestic availability of goods and services

It is of interest to analyse the domestic availability of a particular product, or of all goods and services for a particular year. The domestic availability of a product is defined as total domestic production minus exports plus imports. These values can be read directly from the supply and use tables. In 2005 the domestic production of grain mill products was R27 294 million (row P16 and column TI, of the supply table), while total exports were R758 million (row P16 and column F2, of the use table) and imports were R1 767 million (row P16 and column F1, of the supply table).

Thus, the domestic availability of this product at purchasers’ prices is R33 621 million, made up of domestic production (R27 294 million) *minus* exports (R758 million) *plus* imports (R1 767 million) *plus* taxes less subsidies on products (R1 556 million) *plus* trade and transport margins (R3 762 million).

Import share

The data used in the preceding section also allows for the calculation of the import share of a product, that is, what portion of the domestic availability of a product comes from foreign countries. From these data, the import share for the same commodity can be calculated as follows:

$$(\text{Total imports} / \text{Total domestic availability}) \times 100.$$

That is for 2005:

$$(\text{R1 767 million} / \text{R33 621 million}) \times 100 = 5,26\%$$

Export share

Countries with considerable foreign trade have a keen interest in measures of export performance. A simple indicator of such performance is the proportion of total domestic production that is exported. Using the same commodity as in the previous illustrations, 2,25% of the domestic production of grain mill products was exported in 2005, calculated as follows:

$$(\text{R758 million} / \text{R33 621 million}) \times 100 = 2,25\%.$$

Table 1 - Supply of products at basic prices 2005 - R million

ADDITIONAL INFORMATION

Explanatory notes

- | | |
|---|--|
| Introduction | 1 This publication contains SU-tables for 2005, compiled in accordance with the recommendations of the 1993 System of National Accounts. |
| Scope of the supply and use tables | 2 The SU-tables cover the entire economy. One hundred and seventy one different industry groups, one hundred and four product groups and six different components of final demand are distinguished. |
| Classification | 3 The 1993 edition of the Standard Industrial Classification of all Economic Activities (SIC), Fifth Edition, Report No. 09-90-02 was used to classify the industries or economic activities in the System of National Accounts. The SIC is based on the 1990 (third revision) International Standard Industrial Classification of all Economic Activities (ISIC), with suitable adaptations for local conditions. The third revision of the ISIC differs in various respects from the previous edition. Therefore, the fifth edition of the SIC also differs from previous editions. Table K provides information on the industry groups that are included in the SU-tables.

The Central Product Classification (CPC) version 2 was used to classify the products. More information on the product groups is provided in table J. |
| Reference period and time of recording | 4 The tables record production activities and transactions of goods and services conducted in South Africa during the reference year, i.e. 2005. Domestic production of goods is recorded at the time they are produced and that of services at the time they are provided. Intermediate consumption of goods and services is recorded at the time they are actually used in the production process. Final consumption of goods and services by households and general government is recorded at the time they are purchased irrespective of their delivery in general. Goods for fixed capital formation are recorded at the time they are delivered, and changes in inventories are recorded at the time legal proprietary rights are transferred. Imports and exports are recorded at the time of customs clearance. |

Rounding-off of figures

- 8** The figures have been rounded off to the nearest million. There may therefore be slight discrepancies between the sums of the constituent industries and the totals shown.

Annexure 1 – Key between products used in the SU-tables and CPC groups

The abbreviated description of products used in the SU-tables and the corresponding CPC groups codes are shown in table J.

Annexure 3 – Description of adjustment items, components of value added and final demand

The description of the adjustment items, components of value added and final demand used in the SU-tables are detailed in table L.

Table L – Description of adjustment items, components of value added and final demand

Item no.	SU-tables description	Detailed description
C1	c.i.f./f.o.b. adjustment	Adjustment of detailed imports (valued c.i.f.) to total imports (valued f.o.b.)
D1	Purchases by residents	Direct purchases abroad by residents.
D2	Purchases by non-residents	Direct purchases in the domestic market by non-residents.
F1	Imports	Import of goods and services.
F2	Exports	Export of goods and services
F3	Household consumption expenditure	Final consumption expenditure incurred by households
F4	General government consumption expenditure	Final consumption expenditure incurred by general government
F5	Fixed capital formation	Gross fixed capital formation
F6	Changes in inventories	Changes in inventories
V1	Total gross value added / GDP	Sum of value added for industries or gross domestic product for the economy.
V2	Compensation of employees	Compensation of employees
V3	Taxes less subsidies	Taxes less subsidies on production and imports
V4	Taxes on products	Taxes on products
V5	Subsidies on products	Subsidies on products
V6	Other taxes less subsidies	Other taxes on production less subsidies on production
V7	GOS / mixed income	Gross operating surplus of industries / Gross mixed income of households

Annexure 4 – Statistical sources and methods

Table M summarises the most important statistical sources and methods used to compile the 2005 supply and use tables for each industry. Different statistical sources were used to calculate the required levels, e.g. total output, value added and intermediate consumption. The estimation of detailed output and consumption according to commodity is briefly referred to as well.

In addition to the detailed industry specific sources that are listed in table M, extensive use is made of the Annual Financial Statistics (AFS) conducted by Stats SA. The AFS is a comprehensive collection covering the entire economy, excluding agriculture, financial intermediaries and the general government sector. It includes financial information relating to the income and expenditure statements of enterprises as well as their balance sheets.

Table M – Statistical sources and methods

Industry	Statistical sources and methods
Agriculture, Forestry and Fishing	The census of commercial agriculture 2007, conducted by Stats SA on behalf of the National Department of Agriculture (DoA) was used.
Mining	Mining structural information was obtained from the 2004 large sample survey that was published by Stats SA. This information was supplemented by gold mining industry information from the Chamber of Mines and information from the Department of Minerals and Energy (DME).
Manufacturing	Manufacturing structural information was obtained from the 2005 large sample survey that was published by Stats SA.
Electricity, gas and water	Electricity, gas and water structural information was obtained from the 2006 large sample survey published by Stats SA. This information was supplemented by annual reports and financial statements obtained from ESKOM, the water boards and local authorities.
Construction	Construction structural information was obtained from the 2004 large sample survey that was published by Stats SA. Information on gross domestic fixed investment of residential and non-residential buildings compiled by the SARB.
Wholesale, retail and motor trade	Wholesale and retail trade structural information was obtained from the 2005 large sample surveys and motor trade from the 2006 large sample survey published by Stats SA.
Hotels and restaurants	Accommodation structural information was obtained from the 2004 large sample survey published by Stats SA.

Table M – Statistical sources and methods (continued)

Industry	Statistical sources and methods
Transport and communication	Transport and communication structural information was obtained from the 2006 large sample survey published by Stats SA. Information from financial statements of major role players such as Transnet, Telkom and South Africa Post Office. Information on an independent research done regarding the Taxi industry.
Financial intermediation and insurance	Annual and quarterly surveys conducted by the SARB among the various institutions in the private sector and information reported by public authorities and public corporations. Sample survey of large institutions in the banking and insurance industry.
Real estate (including imputed rent on residential buildings) and business services	Business services structural information was obtained from the 2006 large sample survey published by Stats SA. Estimates on housing stock and rental value were obtained from the 2007 community survey, 2005/6 income and expenditure survey and the 2005 general household survey.
Other personal services	Personal services structural information was obtained from the 2004 large sample survey published by Stats SA.
General government services	<p>Government Financial Statistics (GFS) and Basic Accounting System (BAS) data of Stats SA, information from SARB, and annual reports from Local Government Authorities.</p> <p>The intermediate consumption expenditure of the general government was derived through the classification of detailed expenditure by different government departments, provincial governments and local government authorities.</p>
Non-observed economy and informal sector	<p>Information on non-observed economy was obtained from administrative and enforcement records of the South African Police Services (SAPS), South African Revenue Services (SARS), other associations (e.g. SWEAT for prostitution) and information on other country experiences.</p> <p>Informal sector estimates were based on the 2004 survey of employers and self-employed and the labour force survey.</p>
Private consumption expenditure	Information obtained from SARB and the 2005/6 income and expenditure survey.
Government consumption expenditure	Government Financial Statistics (GFS) and Basic Accounting System (BAS) data published by Stats SA and information from SARB.

Table M – Statistical sources and methods (concluded)

Industry	Statistical sources and methods
Gross fixed capital formation	<p>Information contained in various economic surveys, estimates of fixed capital formation published by SARB, construction activities of the general government published by Stats SA, information on imported and exported capital goods.</p> <p>The gross fixed capital formation by type of product is estimated through the commodity flow approach. These results are evaluated against estimates obtained from various other models.</p>
Changes in inventories	<p>Information contained in various economic surveys, estimates of changes in inventories published by SARB. The changes in inventories for raw materials, work-in-progress and finished goods were estimated separately according to type of product for each industry.</p>
Imports	<p>Detailed trade statistics from SARS and information from SARB. Detailed information on imports was reclassified from the Harmonised Commodity Classification System to the level of detail required in the SU-tables. The adjustment of c.i.f. and f.o.b. was based on information from both sources.</p>
Exports	<p>Detailed trade statistics from SARS and information from SARB. Detailed information on exports was reclassified from the Harmonised Commodity Classification System to the level of detail required in the SU-tables.</p>
Taxes and subsidies on production and imports	<p>Information contained in various economic surveys, Auditor-General reports, information from SARS and the Economic and Functional Classification of the Expenditure of General Government.</p>
Trade and transport margins	<p>Periodic large sample surveys of Wholesale Trade, Commercial Agents; Retail Trade; Motor Trade and Repair Services; and Transport and Allied Services published by Stats SA, as well as information obtained from Transnet.</p>
Direct purchases abroad (in domestic market) by (non-) residents	<p>Unpublished information from SARB.</p>

Glossary

Ancillary activity	An ancillary activity is a supporting activity undertaken to create the conditions within which the activities of an enterprise are carried out.
Balancing item	A balancing item is an accounting construct obtained by subtracting the total value of the entries on one side of an account from the total value of the entries on the other side. Balancing items are not simply devices introduced by the 1993 SNA to ensure that accounts balance. They encapsulate a great deal of information and include some of the most important entries in the accounts, for example value added and operating surplus.
Basic price	The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output <i>minus</i> any tax payable <i>plus</i> any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any transport charges invoiced separately by the producer. Basic price is the preferred method of valuing output.
Benchmark years	Benchmark years refer to those years in respect of which authoritative and detailed data are available
Commodity flow method	The commodity flow method is used to track the flow of goods and services from the supply (domestic production or imported) to the use (intermediate consumption, final consumption or exports) thereof.
Compensation of employees	Compensation of employees is defined as the total remuneration, in cash or kind, payable by an employer to an employee in return for work done by the latter during the accounting period. It is recorded on a gross basis, i.e. before any deduction for income taxes, pensions, unemployment insurance and other social insurance schemes. It also includes other forms of compensation, namely commissions, tips, bonuses, directors' fees and allowances such as those for holidays and sick leave, as well as military pay and allowances. It excludes employers' social contributions.
Cost, insurance and freight price	The cost, insurance and freight price (c.i.f.) is the price of a good delivered at the frontier of the importing country, or the price of a service delivered to resident, before payment of any import duties or other taxes on imports or trade and transport margins within the country.
Enterprise	An enterprise may be a corporation (a quasi-corporate enterprise is treated as if it is a corporation in the 1993 SNA), a non-profit institution or an unincorporated enterprise. Corporate enterprises and non-profit institutions are complete institutional units. An unincorporated enterprise, however, refers to an institutional unit - a household or government unit - only in its capacity as a producer of goods and services. It covers only those activities of the unit, which are directed towards the production of goods and services.

Establishment	An establishment is defined as an enterprise or part of an enterprise that is situated at a single location and in which only a single (non-ancillary) productive activity is carried out or in which the principal productive activity accounts for most of the value added.
Factor cost	Factor cost is a valuation concept reflecting the cost of the factors of production (labour and capital). It corresponds to the value remaining after all applicable taxes and subsidies have been deducted from market prices.
Final demand	Different components of final demand are distinguished in the SU-tables. The supply table shows imports and the use table shows final consumption expenditure by households and the general government as well as gross capital formation (gross fixed capital formation and changes in inventories) and exports.
Financial services indirectly measured	Financial services indirectly measured (FSIM) are measured in the SNA as the total property income receivable by financial intermediaries minus their total interest payable, excluding the value of any property income receivable from the investment of their own funds. Therefore, income does not arise from financial intermediation.
Free on board price	The free on board price (f.o.b.) is the purchaser's price paid by an importer taking delivery of goods at the exporter's frontier after loading on to a carrier and after payment of any export taxes or the receipt of any tax rebates.
GDP at market prices	GDP at market prices equals total gross value added at basic prices <i>plus</i> taxes on products <i>minus</i> subsidies on products.
GDP for the economy	GDP for the entire economy is equal to GDP at market prices. It is essentially a production measure as it is obtained through the sum of the gross values added of all resident institutional units, in their capacity as producers, <i>plus</i> the values of any taxes, <i>less</i> subsidies, on production or imports not already included in the values of the outputs and values added by resident producers.
Generation of income account	The generation of income account provides for the distribution of primary incomes to the various institutional sectors. Primary incomes are incomes that accrue to institutional sectors and industries as a consequence of their involvement in processes of production or ownership of assets that may be needed for purposes of production.
Goods and services account	The goods and services account shows the total resources (output and imports) and uses of goods and services (intermediate consumption, final consumption, gross capital formation and exports). Taxes on products (less subsidies) are also included on the resource side of the accounts.

Gross operating surplus/Mixed income	Gross operating surplus or mixed income is the balancing item in the generation of income account, i.e. the value added <i>minus</i> compensation of employees payable <i>minus</i> taxes on production payable <i>plus</i> subsidies receivable.
Gross value added at basic prices	Gross value added at basic prices is defined as output valued at basic prices less intermediate consumption valued at purchasers' prices.
Gross value added at producer's prices	Gross value added at producers' prices is defined as output valued at producers' prices less intermediate consumption valued at purchasers' prices.
Homogeneous production	A unit of homogeneous production is defined as a producer unit in which only a single (non-ancillary) productive activity is carried out.
Industries	Industries consist of groups of establishments engaged in the same or similar kinds of activity. The definition of industries are based on the 1993 SNA and is in line with that contained in the Standard Industrial Classification of all Economic Activities, Fifth Edition, Report No. 09-90-02 of January 1993 (SIC).
Institutional unit	An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities.
Intermediate consumption	Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets. Consumption of fixed assets is recorded as consumption of fixed capital.
Non-observe economy	The non-observe economy is the extent of the economic activity missing from statistical data collections and from administrative source.
Other taxes on production	Other taxes on production consist of taxes on the ownership of land, buildings or other assets used in production or on labour employed, etc. Important examples of other taxes on production are taxes on payroll or work force, business or professional licenses.
Output	Output consists of those goods or services that are produced within an establishment that become available for use outside the establishment, plus any goods and services produced for own final use.
Operating surplus or mixed income	Operating surplus or mixed income is the balancing item in the generation of income account i.e. the value added minus compensation of employees payable minus taxes on production payable plus subsidies receivable.
Primary industries	The primary industries include the agriculture, forestry and fishing, mining and quarrying industries.

Principal activity	The principal activity of an establishment is the activity whose gross value added exceeds that of any other activity carried out within the same unit.
Producers' price	The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser. It excludes any transport charges invoiced separately by the producer.
Production account for the total economy	The production account is the first in the sequence of accounts compiled for institutional sectors, industries and the total economy. The production account contains three items apart from the balancing item namely output, intermediate consumption and taxes less subsidies on products. The output is recorded under resources on the right-hand side of the account. Intermediate consumption and taxes less subsidies on products is recorded under uses on the left-hand side of the account.
Production boundary	The general production boundary is defined as an economic activity (or production) carried out under the control and responsibility of an institutional unit that uses inputs of labour, capital, and goods and services to produce output of goods and services. The production boundary in the 1993 SNA is more restricted than the general production boundary due to the production accounts not being compiled for household activities that produce domestic or personal services for own final consumption within the same household, except for services produced by paid domestic staff.
Purchasers' price	The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.
Secondary activity	A secondary activity is an activity carried out within a single establishment in addition to the principal activity.
Secondary industries	The secondary industries include the manufacturing, electricity, gas, water and construction industries.
Square	A matrix is square when it has an equal number of columns and rows.
Other subsidies on production	Subsidies are transfers from the government to the business sector toward current cost of production. These transfers represent additions to the income of producers from current production.
Subsidies on products	Subsidies on products are payable per unit of a good or service.

Supply and use tables	The SU-tables are sometimes referred to as rectangular input-output tables, make and use tables, supply and disposition of commodities tables.
Supply table	The supply table gives information about the resources of goods and services.
Symmetric	Symmetric tables use similar classifications or units, i.e. same groups of products for both the rows and the columns.
System of National Accounts	System of National Accounts refers to an internationally agreed standard system for macro-economic accounts. The latest version is described in the 1993 System of National Accounts (1993 SNA).
Taxes on income	Taxes on income consist of taxes on incomes, profits and capital gains. They are assessed on the actual or presumed incomes of individuals, households, non-profit institutions serving households (NPISH) or corporations. They include taxes assessed on holdings of property, land or real estate when these holdings are used as a basis for estimating the income of their owners.
Taxes on production and imports	Taxes on production and imports are taxes, which add to the cost of production and are likely to be reflected in market prices paid by the purchaser, such as sales and excise taxes, import duties and property taxes. Taxes on production and imports include taxes on products and other taxes on production.
Taxes on products	Taxes on products consist of taxes payable on goods and services when they are produced, delivered, sold or otherwise disposed of by their producers. Furthermore, they are payable per unit of a good or service produced. Important examples of taxes on products are excise and import duties and VAT.
Tertiary industries	Tertiary industries include wholesale and retail trade and motor trade; catering and accommodation; transport and communication; finance, real estate and business services; community, social and personal services; general government services; and other producers.
Use Table	The use table gives information on the uses of goods and services, and also on cost structures of the industries.
Value added components	The use table distinguishes three different components of value added, i.e. compensation of employees, other taxes less subsidies on production and gross operating surplus/mixed income.
Value added by industry	Value added measures the value created by production and may be calculated either before or after deducting the consumption of fixed capital on the fixed assets used. Gross value added is defined as the value of output less the value of intermediate consumption. Value added is the balancing item in the production account for an institutional unit or sector, or establishment or industry.
