Preface

This report contains the 2010 Supply and Use tables (SU-tables), estimated according to the recommendations of the 2008 System of National Accounts (2008 SNA). The 2008 SNA is an updated version of the 1993 SNA, bringing the national accounting framework into line with the needs of data users. The 2008 SNA is also consistent with related manuals such as balance of payments, government finance statistics and monetary and financial statistics. The 2008 SNA was prepared under the auspices of the Inter-Secretariat Working Group on National Accounts (ISWGNA). This group consists of the Statistical Office of the European Community (EUROSTAT), the International Monetary Fund (IMF), the Organisation for Economic Co-operation and Development (OECD), the United Nations Statistical Division and regional commissions of the United Nations Secretariat and the World Bank.

The SU-tables, often regarded as the cornerstone of the SNA, have statistical and analytical functions. As a statistical tool they serve as a coordinating framework for economic statistics, both conceptually for ensuring the consistency of the definitions and classifications used, and as an accounting framework for ensuring the numerical consistency of data obtained from different sources (i.e. industrial surveys, household surveys, investment surveys, foreign trade statistics, etc.).

As an analytical tool, the tables serve as a basis for calculating the economic data contained in the national accounts, and for detecting weaknesses in the economic data. Moreover, they are conveniently integrated into macroeconomic models in order to analyse the link between final demand and industry output levels.

The SU-tables also have many other uses. These include the extension of the tables to:

- symmetric input-output tables, i.e. tables focusing on the inter-relationships between industries in an economy with respect to the production and uses of its products and the products imported from abroad;
- social accounting matrices, i.e. matrices elaborating on the linkages between SU-tables and institutional sector accounts; and
- satellite accounts, i.e. accounts linking the SNA with specific fields of enquiry.

Interpretive summary

Background

Statistics South Africa (Stats SA) partially implemented the 2008 System of National Accounts (2008 SNA) in conjunction with rebasing and benchmarking gross domestic product (GDP) estimates in 2014: revised annual estimates for the period 2004–2013 and the first estimate for the third quarter of 2014 were published on 25 November 2014 (statistical release P0441, Gross domestic product). The purpose of the benchmark process was to develop an integrated, coherent set of statistics that will inform users on the dynamics of the economy.

This statistical release contains revised estimates of GDP for the period 2004 to 2013. It is calculated from all three approaches to calculating GDP.

Major revisions of the national accounts were necessary in 2014 due to:

- The change in the base year for the estimates at constant prices;
- The availability of new sources of information such as Annual financial statistics (AFS), Large sample surveys (LSSs), Income and expenditure survey (IES) and the population census;
- Improvements in methodology;
- The partial implementation of the 2008 SNA, namely the four major changes that are applicable to GDP; and
- Revisions of basic economic datasets as part of Stats SA's economic improvement strategy.

In accordance with international best practice, an update of the base year accompanied by revisions of the GDP estimates has taken place regularly every five years in South Africa.

The SNA requires countries to compile supply and use tables (SU-tables) as they form an integral part of the SNA. According to the SNA, the annual estimates of gross value added and its components, as well as output, intermediate consumption expenditure, final consumption expenditure and GDP should all have their origin in the annual SU-tables. This is because these tables have been developed to check the accuracy and consistency of the economic data contained in the national accounts.

The SU-tables are intended to include all the transactions in goods and services in an economy for a specific year, e.g. 2010, in a matrix format. They allow for close examination of consistency in the national accounts by linking and integrating the various components within a single framework.

As an extension to the implementation of different versions of SNA, Stats SA compiled the first official SU-tables for South Africa for the 1993 reference year and published it in December 1999. Stats SA has been publishing SU-tables annually as from the 1998 reference year. This will ensure an extended time-series of the SU-tables and also assist in analysing and evaluating the performance of the economy over time.

Integration with national accounts

The SU-tables are used to estimate the annual GDP estimates. The 2010 SU-tables are therefore reconciled with the national accounts estimates of GDP by activity and the expenditure on GDP.

Interpretation

The SU-tables serve as a coordinating framework to ensure the numerical consistency and accuracy of data obtained from different sources (i.e. industrial surveys, households surveys, investment surveys and trade statistics). The SU-tables are also important in analysing and evaluating the performance of an economy over time.

However, as this latter function is dependent on the availability of an extended time-series of SU-tables, the analysis is limited to a brief comparison of some of the more important findings regarding the period 2007–2010.

Components of gross value added by industry

Gross value added at basic prices is defined as output valued at basic prices less intermediate consumption valued at purchasers' prices. Table A shows the components of gross value added at basic prices by industry for 2007, 2008, 2009 and 2010. An analysis of the percentage contribution of the components of gross value added to total gross value added at basic prices for different industries shows that in certain industries, compensation of employees is the largest contributor to the total gross value added by a specific industry. In other industries, operating surplus is the largest contributor to the total gross value added by a specific industry.

In 2010, compensation of employees accounted for 85,8% of total gross value added in general government services (compared with 83,2% in 2007, 83,1% in 2008, and 84,6% in 2009). The construction industry experienced a decrease in compensation of employees as a proportion (46,4% in 2010 compared with 49,1% in 2007). In the transport, storage and communication industry, compensation of employees accounted for 32,5% in 2010 compared with 29,0% in 2007, 29,6% in 2008 and 30,8% in 2009. In the agriculture, hunting, forestry and fishing industry, gross operating surplus accounted for 70,4% of total gross value added in 2010, down from 73,6% in 2007, 75,4% in 2008 and 73,1% in 2009 (Table A).

The percentage contribution of taxes less subsidies on production is small in all cases.

Table A – Percentage contribution of components of gross value added to total gross value added at basic prices according to industry: 2007, 2008, 2009 and 2010

Industry	Year	Compensation of employees	Gross operating surplus/mixed income	Taxes less subsidies on production	Total gross value added
Agriculture, hunting, forestry and fishing	2007	26,4	73,6	0,1	100,0
	2008	24,6	75,4	0,0	100,0

	2008	47,8	51,0	1,3	100,0
	2009	48,6	50,0	1,4	100,0
	2010	49,5	49,1	1,4	100,0

Output of industries according to type of input

Output consists of those goods or services that are produced within an establishment that become available for use outside the establishment, plus any goods and services produced for own final use.

Table B reflects a breakdown of output by the primary, secondary and tertiary sectors according to type of input in 2007, 2008, 2009 and 2010. It is interesting to note that in the case of the primary and tertiary sectors, gross value added constituted more than 50% of output in these years, while in the secondary sector, gross value added constituted just over 25% of its output. Furthermore, it is evident that the secondary sector is the largest user of secondary products which serve as intermediate inputs.

Table B – Output of sectors according to type of input: 2007, 2008, 2009 and 2010

Input	Year	Output of primary sector		Output of secondary sector		Output of tertiary sector	
		R million	% contribution	R million	% contribution	R million	% contribution
Primary product	2007	9 025	2,2	237 631	15,2	3 445	0,1
	2008	11 436	2,3	280 731	15,5	4 219	0,2
	2009	15 653	3,1	297 223	16,3	5 243	0,2
	2010	22 510	4,1	306 959	15,9	7 607	0,3
Secondary product	2007	94 180	23,4	658 739	42,1	298 382	13,0
	2008	114 984	23,6	757 358	41,9	358 688	14,0

Total	2007	401 995	100,0	1 563 591	100,0	2 302 476	100,0
	2008	487 692	100,0	1 808 281	100,0	2 563 930	100,0
	2009	502 910	100,0	1 818 354	100,0	2 742 643	100,0
	2010	548 267	100,0	1 928 868	100,0	2 984 440	100,0

Final demand

Different components of final demand are distinguished in the SU-tables. The supply table shows imports of goods and services and the adjustments made to imports for differences between cost of insurance and freight (c.i.f.), and free on board (f.o.b.). The use table shows final consumption expenditure by households and general government as well as gross capital formation (gross fixed capital formation and changes in inventories) and exports of goods and services.

The composition of final demand consists of household consumption expenditure of 46,3% in 2010, followed by exports (22,5%), government consumption expenditure (15,9%) and gross capital formation (15,1%).

The supply of products at basic prices

In the 2008 SNA, basic prices is the preferred method of valuing output. The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any tax payable *plus* any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any transport charges invoiced separately by the producer. The total supply of products (e.g. agriculture, hunting, forestry and fishing products) at basic prices can be grouped according to their origin, i.e. whether the products are domestically produced or imported.

Table C – Supply of products at basic prices according to origin: 2007, 2008, 2009 and 2010

Type of product	Year	Domestically produced goods		Imports	
		R million	% contribution	R million	% contribution
Agriculture, hunting, forestry and fishing	2007	124 833	2,9	6 861	1,0
	2008	151 694	3,1	8 743	1,0
	2009	154 334	3,0	6 748	1,0
	2010	157 576	2,9	7 356	1,0

	2010	5 461 575	100,0	752 233	100,0

Table C shows the breakdown of domestically produced goods and imports by type of product.

The most important domestically produced goods for 2007, 2008, 2009 and 2010 were manufactured goods, which amounted to R1 174 842 million and accounted for 27,5% of domestically produced goods in 2007, R1 336 135 million (27,5%) in 2008, R1 303 103 million (25,7%) in 2009 and R1 466 291 million (26,8%) in 2010; followed by trade, transport and distribution, which amounted to R760 594 million (17,8%) in 2007, R841 891 million (17,3%) in 2008, R898 757 million (17,7%) in 2009 and R1 032 860 million (18,9%) in 2010; and community, social and personal services, which amounted to R664 878 million (15,6%) in 2007, R763 412 million (15,7%) in 2008, R847 905 million (16,7%) in 2009 and R887 507 million (16,3%) in 2010.

Imported goods in 2010 were predominantly manufactured goods with 71,1%, compared with 72,8% in 2007, 72,1% in 2008 and 71,1% in 2009; followed by trade, transport and distribution, which accounted for 10,6% in 2010, compared with 10,9% in 2007, 10,8% in 2008 and 10,6% in 2009.

Use of products at purchasers' prices

The 2008 SNA recommends that intermediate and final consumption expenditure be valued at purchasers' prices. The purchaser's price is the amount paid by the purchaser, excluding any deductible value added tax (VAT) or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

Table D (p. 7) shows the use of products at purchasers' prices according to destination for 2007, 2008, 2009 and 2010, namely intermediate consumption expenditure and final consumption expenditure, including exports. Comparing the total final consumption expenditure for 2010 with 2007, 2008 and 2009, it is evident that expenditure on (the use of) certain products has changed over the years as recorded below.

- Metal, machinery and equipment: 17,1% in 2010 compared with 19,4% in 2007, 19,7% in 2008 and 17,5% in 2009;
- Construction: 6,9% in 2010 compared with 6,6% in 2007, 7,3% in 2008 and 7,8% in 2009;
- Finance, real estate and leases: 10,3% in 2010 compared with 10,0% in 2007, 10,3% in 2008, and 10,3% in 2009;
- Business and production services: 3,9% in 2010 compared with 3,7% in 2007, 3,6% in 2008 and 3,9% in 2009; and
- Community, social and personal services: 22,2% in 2010 compared with 19,9% in 2007, 19,6% in 2008 and 22,0% in 2009.

When comparing total intermediate consumption expenditure for 2010 with total intermediate consumption expenditure for 2007, 2008 and 2009, these are the expenditure patterns recorded for the following products.

- Trade, transport and distribution: 8,1% in 2010 compared with 9,6% in 2007, 9,5% in 2008 and 10,3% in 2009;
- Finance, real estate and leases: 16,7% in 2010 compared with 14,8% in 2007, 13,8% in 2008 and 13,7% in 2009;
- Business and production services: 11,3% in 2010 compared with 15,0% in 2007, 14,8% in 2008 and 15,7% in 2009; and
- Community, social and personal services: 4,8% in 2010 compared with 6,0% in 2007, 5,9% in 2008 and 6,3% 2009.

Table D – Use of products at purchasers' prices according to destination: 2007, 2008, 2009 and 2010

Type of product	Year	Total final consumption expenditure ^{1/}		Total intermediate consumption expenditure	
		R million	% contribution	R million	% contribution
Agriculture, hunting, forestry and fishing	2007	73 414	2,6	76 262	3,2
	2008	83 407	2,6	96 521	3,5

1/ Total final consumption expenditure = Households consumption expenditure + General government consumption expenditure + Fixed capital formation + Changes in inventories + Exports

Methodological notes

Background to the 2008 SNA and SU-tables

The publication *2010 Supply and Use tables* is the third official detailed supply and use tables published by Statistics South Africa. The first official SU-tables for the 1993 reference year were published in 1999. Stats SA has been publishing SU-tables annually as from the 1998 reference year. This will ensure an extended time-series of the SU-tables and also assist in analysing and evaluating the performance of the economy over time.

Apart from many new aspects, the 2008 SNA includes a consistent and integrated set of SU-tables, which – among other features – provide a detailed analysis of the process of production, the use of goods and services (products) and the income generated in that production. In other words, its role in the 2008 SNA is primarily related to the production account and to the goods and services accounts and generation of income accounts. This ensures that the information contained in the SU-tables and the other components of the national accounts, such as GDP and expenditure on GDP, are reconciled.

As the role of SU-tables is primarily related to the goods and services account (Table E), production account (Table F) and generation of income account (Table G), these accounts are briefly discussed before attention is given to the structure of the SU-tables.

Goods and services account

The goods and services account (Table E) shows, for the total economy, how the total amount of product available (resources) is equal to the total amount used. Resources are shown on the left-hand side and uses are shown on the right-hand side.

Table E – Goods and services account: 2010

Resources	R million	Uses	R million
Output	5 461 575	Intermediate consumption	2 966 715
Taxes on products	264 191	Final consumption expenditure	2 177 751
Subsidies on products	-11 043	Private consumption expenditure	1 621 839
Imports of goods and services	752 234	Government consumption expenditure	555 912
		Gross capital formation	536 219
		Gross fixed capital formation	529 432
		Changes in inventories	6 787
		Exports of goods and services	786 348
		Residual item	-77
Total resources	6 466 956	Total uses	6 466 956

 25 November 2014

Production account

The production account (Table F) emphasises the concept of GDP or value added as one of the main balancing items in the 2008 SNA. The 2008 SNA recommends the calculation of GDP for the entire economy and the calculation of value added for the various industries. GDP is essentially a production measure as it is obtained through the sum of the gross values added of all resident institutional units, in their capacities as producers, plus the values of any taxes, less subsidies on production or imports not already included in the values of the outputs and values added by resident producers.

Value added measures the value created by production and may be calculated either before (gross) or after (net) deducting the consumption of fixed capital on fixed assets used. Gross value added is defined as the value of output less the value of intermediate consumption. Gross/net value added is the balancing item in the production account for an institutional unit, sector, establishment or industry, while gross/net domestic product is the balancing item in the production accounts for the total economy.

It is important to note that value added does not cover all transactions linked to the production process, but only to the result of production, i.e. output and the utilisation of goods and services when producing this output, i.e. intermediate consumption. In other words, it includes output as a resource (see right-hand side of the production account) and intermediate consumption as a use (see left-hand side of the production account). As the consumption of fixed capital is not shown separately, the resulting balancing item is *gross domestic product*.

Table F – Production account: 2010

Uses	R million	Resources	R million
Intermediate consumption	2 966 715	Output	5 461 575
		Taxes on products	264 191
		Subsidies on products	-11 043
<i>Gross domestic product</i>	<i>2 748 008</i>		

Source: Stats SA: Statistical Release P0441 *Gross Domestic Product: Annual estimates 2004-2013, Third quarter 2014*, 25 November 2014

Generation of income account

The generation of income account (Table G) records distributive transactions resulting from the production process. Distributive transactions consist of transactions by which the value added generated by production is distributed to labour, capital and government, and transactions involving the redistribution of income and wealth (taxes on income and other transfers).

Thus, the resources include gross domestic product and the uses refer to compensation of employees as well as taxes less subsidies on production and imports. The balancing item is gross operating surplus/mixed income. Mixed income refers to the balancing item in the generation of income account for the household sector. The reason is that the surplus generated by un-incorporated household enterprises includes both remuneration for the labour of the owner as well as a return to the entrepreneurship and capital employed.

Table G – Generation of income account: 2010

Uses	R million	Resources	R million
Compensation of employees	1 234 707	Gross domestic product	2 748 008
Taxes on production and imports	309 273		
Taxes on products	264 191		
Other taxes on production	45 082		
Subsidies	-20 883		
Subsidies on products	-11 043		
Other subsidies on production	-9 790		
<i>Gross operating surplus/mixed income</i>	<i>1224 861</i>

Concepts and definitions applicable to SU-tables

The 2008 SNA clarifies, inter alia, the concepts and definitions used for the valuation of output of goods and services, intermediate consumption, and value added. The concepts and definitions applicable to the SU-tables are briefly discussed below.

Output of goods and services

Output consists only of those goods and services that are produced within an establishment and that become available for use outside that establishment and for own final use in that establishment. Output may be valued in various ways. The SNA prescribes three ways in which output of goods and services may be measured, namely at basic prices, producers' prices or purchasers' prices.

- The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any tax payable (e.g. excise duties and value added tax (VAT)) *plus* any subsidy receivable on that unit as a consequence of its production or sale. Basic prices *exclude* any transport charges invoiced separately by the producer.
- Producers' price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output *minus* any VAT, or similar deductible tax, invoiced to the purchaser. It *excludes* any transport charges invoiced separately by the producer.
- Purchasers' price is the amount paid by the purchaser, *excluding* any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good *includes* any transport charges paid separately by the purchaser to take delivery at the required time and place.

The relationship between the above-mentioned concepts can be expressed as follows:

Output at basic prices
plus taxes on products (excluding VAT)
less subsidies on products
 = Output at producers' prices
plus trade and transport margins
plus non-deductible VAT
 = Output at purchasers' prices

Basic prices is the preferred method of valuing output of goods and services produced for the market, especially when a system of VAT is in operation.

Intermediate consumption	<p>With regard to the valuation of intermediate consumption, i.e. expenditure by enterprises on goods and services consumed as inputs in the production process, the SNA recommends that it should be valued at purchasers' price. Intermediate inputs purchased and/or transferred from other establishments belonging to the same enterprise should be valued at the same prices as used to value them as outputs of those establishments, plus any additional transport charges not included in the output values.</p>
Gross value added	<p>The 2008 SNA recommends that gross value added by the various industries be valued at basic prices, both at current and constant prices. It is important to note that gross value added at basic prices excludes any taxes payable on products and includes any subsidies receivable on products. As the basic price measures the amount retained by the producer, it is therefore the price most relevant for the producer's decision-taking. Gross value added at basic prices is also the measure preferred and adopted by Stats SA.</p> <p>Previously, South Africa's national accounts measured value added at factor cost. This is no longer the case. In this regard it should be noted that although the 2008 SNA acknowledges that gross value added at factor cost can still be computed, it does not recommend it as a measure of value added due to the non-existence of observable prices such that output minus intermediate consumption equals gross value added. Factor cost is a concept of income rather than production. The expression "at factor cost" means that value added is valued at the cost of factors of production (e.g. capital, labour, land and entrepreneurship). Production or output valued at factor cost excludes taxes on production and imports (e.g. VAT, excise duties, business licences and registration fees) but includes other subsidies on production.</p> <p>In order to derive the GDP at market prices, taxes less subsidies on products must be added to total gross value added at basic prices. It should be noted that GDP at market prices is a measure which is only applicable to the total economy.</p>
The classification and terminology of taxes	<p>Taxes on production and imports include taxes on products and other taxes on production. Taxes on products consist of taxes payable on goods and services when they are produced, delivered, sold or otherwise disposed of by their producers. Furthermore, they are payable per unit of a good or service produced. Important examples of taxes on products are excise and import duties and VAT. Other taxes on production consist of taxes on the ownership of land, buildings or other assets used in production or on labour employed, etc. Important examples of other taxes on production are taxes on payroll or work force, business or professional licences, etc.</p> <p>Current taxes on income and wealth cover all compulsory payments levied by government on the income and wealth of institutional units. These taxes include taxes on individual or household income, taxes on the income or profits of corporations, etc.</p>
Financial intermediaries services indirectly measured (FISIM)	<p>Banks and other financial institutions provide a variety of services. Those that are specifically charged for include currency exchange, investment management, etc., and the corresponding revenues form part of the institutions' output. An additional and very significant part of their income comes from charging borrowers higher interest rates and paying depositors lower interest rates than they would need to if they charged explicitly for all their services. This "hidden" charge is called financial intermediaries services indirectly measured (FISIM). The total value of FISIM is measured in the 1993 SNA as the total property income receivable by financial intermediaries minus their total interest payable, excluding the value of any property income receivable from the investment of their own funds, as such; income does not arise from financial intermediation.</p> <p>The 2008 SNA calculates FISIM by adding (1) the difference between the rate paid to banks by borrowers and a "reference rate" and (2) the difference between a "reference rate" and the rate paid to depositors. The reference rates used in the calculations will be between the bank interest rates on deposits and loans.</p>

Trade margins	<p>The output of wholesalers and retailers is measured by the value of the trade margins realised on the goods they sell, i.e. the difference between the sale value of products sold and the cost of purchasing these products. The reason for measuring the output of wholesale and retail trade by trade margins is that the productive activity associated with distribution is construed to be the provision of services for displaying the goods in an informative and attractive way. Included in trade margins are estimates regarding the informal sector, i.e. goods sold by stalls, street hawkers and other itinerant merchants.</p>
Transport margins	<p>Transport margins constitute part of the output of transport of goods. Basically, there are two methods of treating transport margins in an SU-table.</p> <p>When transport is arranged in such a way that the purchaser has to pay separately for the transport costs, in other words if the transport costs are billed separately, these costs are identified as transport margins. This implies that customers buy not only the goods, but also transport services from producers.</p> <p>If the producer transports the goods, or arranges for them to be transported without extra cost to the purchaser, transportation will appear as intermediate consumption to the producer, and at the same time it will be included in the basic price.</p> <p>The output of passenger transport is not part of transport margins.</p>
Secondary and ancillary production	<p>Establishments often produce products that are not typical of the industries in which they are classified for statistical censuses or surveys. According to the standard industrial classification (SIC) used by Stats SA, the establishment is the statistical unit according to which all economic activities are classified. A business at a particular address is classified in its entirety according to its principal activity in a certain industry, and both principal and secondary products of that establishment then form part of the output of a particular industry. The major output of such a business, which determines its classification, is called its principal output, and its other outputs, typically produced by another industry, are called its secondary output.</p> <p>From the above, it is clear that a secondary activity may be defined as an activity carried out within an establishment in addition to the principal activity and whose output, like that of the principal activity, must be suitable for delivery outside the establishment. In the supply table, secondary products are shown as <i>off diagonal entries</i>. The value added of a secondary activity must be less than that of the principal activity.</p> <p>Ancillary products, in contrast to principal and secondary products, are not intended for use outside the establishment and are also not explicitly recognised and recorded separately in the SU-tables. They are merely supporting activities undertaken within the establishment for purposes of creating the necessary conditions within which the principal and secondary activities can take place.</p> <p>The following kinds of activities are typical examples of ancillary products:</p> <ul style="list-style-type: none"> • keeping records or files; • purchasing and storing of materials or equipment; • cleaning and maintenance of buildings; • provision of security; and • repair and servicing activities.
Gross capital formation	<p>The SNA recommends that gross capital formation be measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables. Due to data constraints, it is not possible to include any estimates for the acquisitions less disposals of valuables in the SU-tables. Furthermore, the 2008 SNA recommends that research and development should be capitalised; this recommendation was implemented in the 2010 SU-tables.</p>

Import data	Import data are adjusted for the difference between cost of insurance and freight (c.i.f.) and free on board (f.o.b.). The adjustment is necessitated by the 1993 SNA recommendation to value imported commodities at c.i.f. prices, but total imports at f.o.b. prices. The difference between the f.o.b. price and the c.i.f. price represents the costs of transportation and insurance between the frontier of the exporting country and the frontier of the importing country.
Structure of SU-tables	The structure of the SU-tables is explained by means of an aggregated set of tables (Tables H and I). In order to simplify references to these SU-tables, the columns of the supply table have been numbered 'SC' and the rows of the supply table have been numbered 'SR', while the columns of the use table have been numbered 'UC' and the rows of the use table have been numbered 'UR'. The intersection of a row and a column is denoted by a colon separating the two applicable numbers, e.g. SC1:SR1. Furthermore, the economy is divided into three sectors, namely primary, secondary and tertiary, as shown in columns SC5 to SC7 and UC4 to UC6. The sum of these three sectors is found in columns SC8 and UC7.
Supply table	The supply table (Table H) shows the origin of the resources of goods and services, depicting products in rows (SR) and sectors in columns (SC). In the rows, the various types of products are presented according to a product classification (Table J). An additional row is added for the adjustment of direct purchases by South African residents abroad. In the columns, information on the output of each sector according to an industrial classification (Table M and Table N), imports, taxes less subsidies on products and trade and transport margins are shown. Furthermore, in the supply table, goods and services produced in the economy are measured at basic prices. Basic price is the preferred method of valuing output in the SNA. The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output <i>minus</i> any tax payable <i>plus</i> any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any transport charges invoiced separately by the producer. The c.i.f./f.o.b. adjustment to import data is shown in column SC10 and row SR4.
Use table	<p>The use table (Table I) shows the uses of goods and services and supplies information on the cost structures of the various sectors. In the rows, the various types of products are presented according to a product classification (Tables K and L). Additional rows are added for the adjustment of direct purchases by South African residents abroad and direct purchases in the domestic market by non-South African residents. The table is divided into three different sections, each with its own characteristics.</p> <p>The <i>first section</i> shows the goods and services used as intermediate consumption at purchasers' prices by sector in columns (UC4–UC6) and by product in rows (UR1–UR5). The total row (UR6) shows intermediate consumption by sector at purchasers' prices.</p> <p>The <i>second section</i> shows the components of final demand (column UC9), namely exports, household consumption expenditure, general government consumption expenditure, fixed capital formation, changes in inventories and the residual item at purchasers' prices.</p> <p>The <i>third section</i> elaborates on the production costs of producers other than intermediate consumption expenditure (columns UC2–UC7 and row UR7), namely compensation of employees, taxes less subsidies on production and imports, consumption of fixed capital and net operating surplus/mixed income.</p> <p>The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.</p>

Uses of SU-tables

The SU-tables, often regarded as the cornerstone of the SNA, have both statistical and analytical functions.

As a statistical tool they provide a coordinating framework for checking the consistency of economic statistics on flows of goods and services obtained from quite different kinds of statistical sources, i.e. industrial surveys, household surveys, investment surveys, foreign trade statistics. Furthermore, the SU-tables serve as a basis for calculating the economic data contained in the national accounts and for detecting weaknesses in the economic data.

As an analytical tool, the tables are conveniently integrated into macroeconomic models in order to analyse the link and interaction between final demand and industrial output levels. This type of analysis, which is also known as impact analysis, enables users at universities and research institutions to use the tables for sophisticated analysis, including market and productivity analysis.

The SU-tables have, in addition to their major statistical and analytical functions mentioned above, many additional uses. The following are some examples of the extended use of supply and use tables:

- Derivation of GDP.
- Other derivations.
- Symmetric input-output tables.
- Social accounting matrices (SAMs).
- Satellite accounts.

Table H – Framework of the supply of products at basic prices: 2010 (R million)

Column no.	SC1 (SC2+SC3+SC4)	SC2	SC3	SC4 (SC8+SC9+SC10)	SC5	SC6	SC7	SC8 (SC5+SC6+SC7)	SC9	SC10

UR7	Gross value added/ GDP		253 148		295 955	522 091	1 676 813	2 494 860	2 748 008	
UR8	Total output at basic prices				548 267	1 928 868	2 984 440	5 461 575		

Derivation of GDP

The production, income and expenditure based components of GDP at current market prices can all be derived from the SU-tables (Tables H and I).

The *production approach* derives GDP at market prices by deducting intermediate consumption expenditure (uses) at purchasers' prices from total output at basic prices after making provision for taxes and subsidies on products as well as trade and transport margins. The corresponding entries for 2010 in Tables H and I are:

	Output at basic prices	SC8:SR6 UC7:UR8	R5 461 575
<i>plus</i>	Taxes less subsidies on products	SC2:SR6	R253 148
<i>plus</i>	Trade and transport margins	SC3:SR6	R0
<i>less</i>	Intermediate consumption (at purchasers' prices)	UC7:UR6	<u>R2 966 715</u>
=	GDP at market prices	UC8:UR7	<u>R2 748 008</u>

The *income approach* to estimate GDP at market prices entails summing all the components of value added, i.e. remuneration of employees and gross operating surplus after making provision for taxes and subsidies on products. In Table I it is shown as column UC8.

	GDP at market prices	UC8:UR7	R2 748 008
--	----------------------	---------	------------

The *expenditure approach* to estimate GDP at market prices entails the summation of the components of final demand, i.e. household consumption expenditure, general government consumption expenditure, fixed capital formation, change in the value of inventories and exports, in the use table (Table I) and subtracting imports as obtained from the supply table (Table H):

	Components of final demand	UC9:UR6	R3 500 241
<i>less</i>	Imports	SC9:SR6	<u>R752 234</u>
=	GDP at market prices	UC8:UR7	<u>R2 748 008</u>

Other derivations

Apart from deriving the GDP according to the various approaches, a number of different valuations regarding goods and services, output, etc., can also be deduced from SU-tables as is illustrated in Tables E and F. The columns on the left of the SU-tables (SC1 and UC1) show the total supply of goods and services at purchasers' prices, i.e. including taxes less subsidies on products and trade and transport margins. Total supply of goods and services at basic prices is shown in column SC4. The columns for trade and transport margins (SC3) and taxes less subsidies on products (SC2+UC2+UC3) are used to derive total supply of products at purchasers' prices from the valuation at basic prices.

Column SC9 refers to imported goods and services. The c.i.f./f.o.b. adjustment to imports is shown in column SC10 and row SR4. GDP at market prices is shown in column UC8, while the components of final demand (final consumption expenditure, gross capital formation, exports and the residual item), also valued at market prices, are shown in column UC9.

The products available in the economy are classified in rows SR1 to SR3 and UR1 to UR3. For each product, total supply and total use in purchasers' prices are equal. The rows SR5 and UR4 refer to direct purchases by South African residents abroad, which are treated as both imports and household expenditures. The expenditure by non-residents in the domestic market is shown in UR5. As it is included in the exports (as a positive entry) and final consumption expenditure by households (as a negative entry), the net value in UC9 is nil.

Total output at basic prices for the different sectors is shown in rows SR6 and UR8. Row UR6 includes total uses at purchasers' prices and UR7 shows gross value added for all sectors and GDP at market prices for the total economy.

The off-diagonal production by a particular sector or group of industries can also be easily deduced from a supply and use table. For example, the intersection SC6:SR1 shows that the secondary sector produced R25 204 million of primary products. Furthermore, the secondary sector produced R207 380 million of tertiary products (SC6:SR3). The value of the secondary sector's principal output (secondary products SC6:SR2) was R1 696 284 million. The negative value (R608 303 million) in SC3:SR3 reflects the total margins that are deducted from tertiary products as they are distributed throughout SC3 to convert supply at basic prices to supply at purchasers' prices.

Details regarding intermediate and final consumption can also be directly obtained from an SU-table, for example the first row of the use table (UR1) shows that primary products were used as intermediate consumption expenditure by the primary sector (R22 510 million), secondary sector (R306 959 million) and tertiary sector (R7 607 million) and as final consumption expenditure (R337 077 million).

Input-output tables

The SU-tables form the basis for the estimation of input-output tables, both at current and at constant prices. From a statistical point of view, input-output tables serve many needs, including a framework for:

- basic data compilation;
- weighting and calculation of index numbers;
- accessing quality and completeness of data;
- developing interrelated price and volume measures; and
- consistency checking.

Symmetric input-output tables can be derived from SU-tables and used for various kinds of analytical purposes, including the analysis of:

- production;
- structure of demand;
- export ratios;
- employment;
- impact studies;
- prices and costs;
- required imports;
- investment and capital;
- exports;
- energy;
- the environment; and
- sensitivity analysis through the construction of (dynamic) output modelling.

Social Accounting Matrices (SAMs)

A SAM elaborates on the linkages between SU-tables and institutional sector accounts. It is a presentation of the SNA in matrix terms that incorporates whatever degree of detail that might be of special interest. To date, builders of SAMs have exploited the available flexibility to highlight special interests and concerns, display various interconnections, disaggregate the households sector, show the link between income generation and consumption, etc. The power of a SAM, as well as the SNA, comes from choosing the appropriate type of disaggregation to study the topic of interest. In addition to a flexible application and the inclusion of various components, a SAM may incorporate more extensive adjustments, which are of a satellite accounting nature, in order to satisfy specific analytical purposes.

Satellite accounts

As in the case of SAMs, the links to the central framework, including the supply and use framework, are of paramount importance in constructing satellite accounts. In some cases, working with the central framework of the SNA, even in a flexible way, is not sufficient. Even though conceptually consistent, the central framework may be overburdened with detail. Moreover, some requirements may conflict with the central conceptual framework and its architecture.

In certain types of analysis, the basic intention is not to use alternative economic concepts, but simply to focus on a specific field or aspect of economic and social life in the context of national accounts. The intent is to make apparent and to describe in more depth aspects that are hidden in the accounts of the framework or surface only in a limited number of points, e.g. tourism. Tourism as such is not a normal industry and cannot be classified separately as for example the manufacturing industry. Various aspects of tourism may appear in detailed classifications of activities, products and purposes. However, specific tourism transactions and purposes appear separately only in a few cases. In order to measure and describe tourism in a national accounts framework, use must be made of satellite accounting. This approach allows for the adaptation of the various classifications and measurement of additional aggregates, such as national expenditure in tourism.

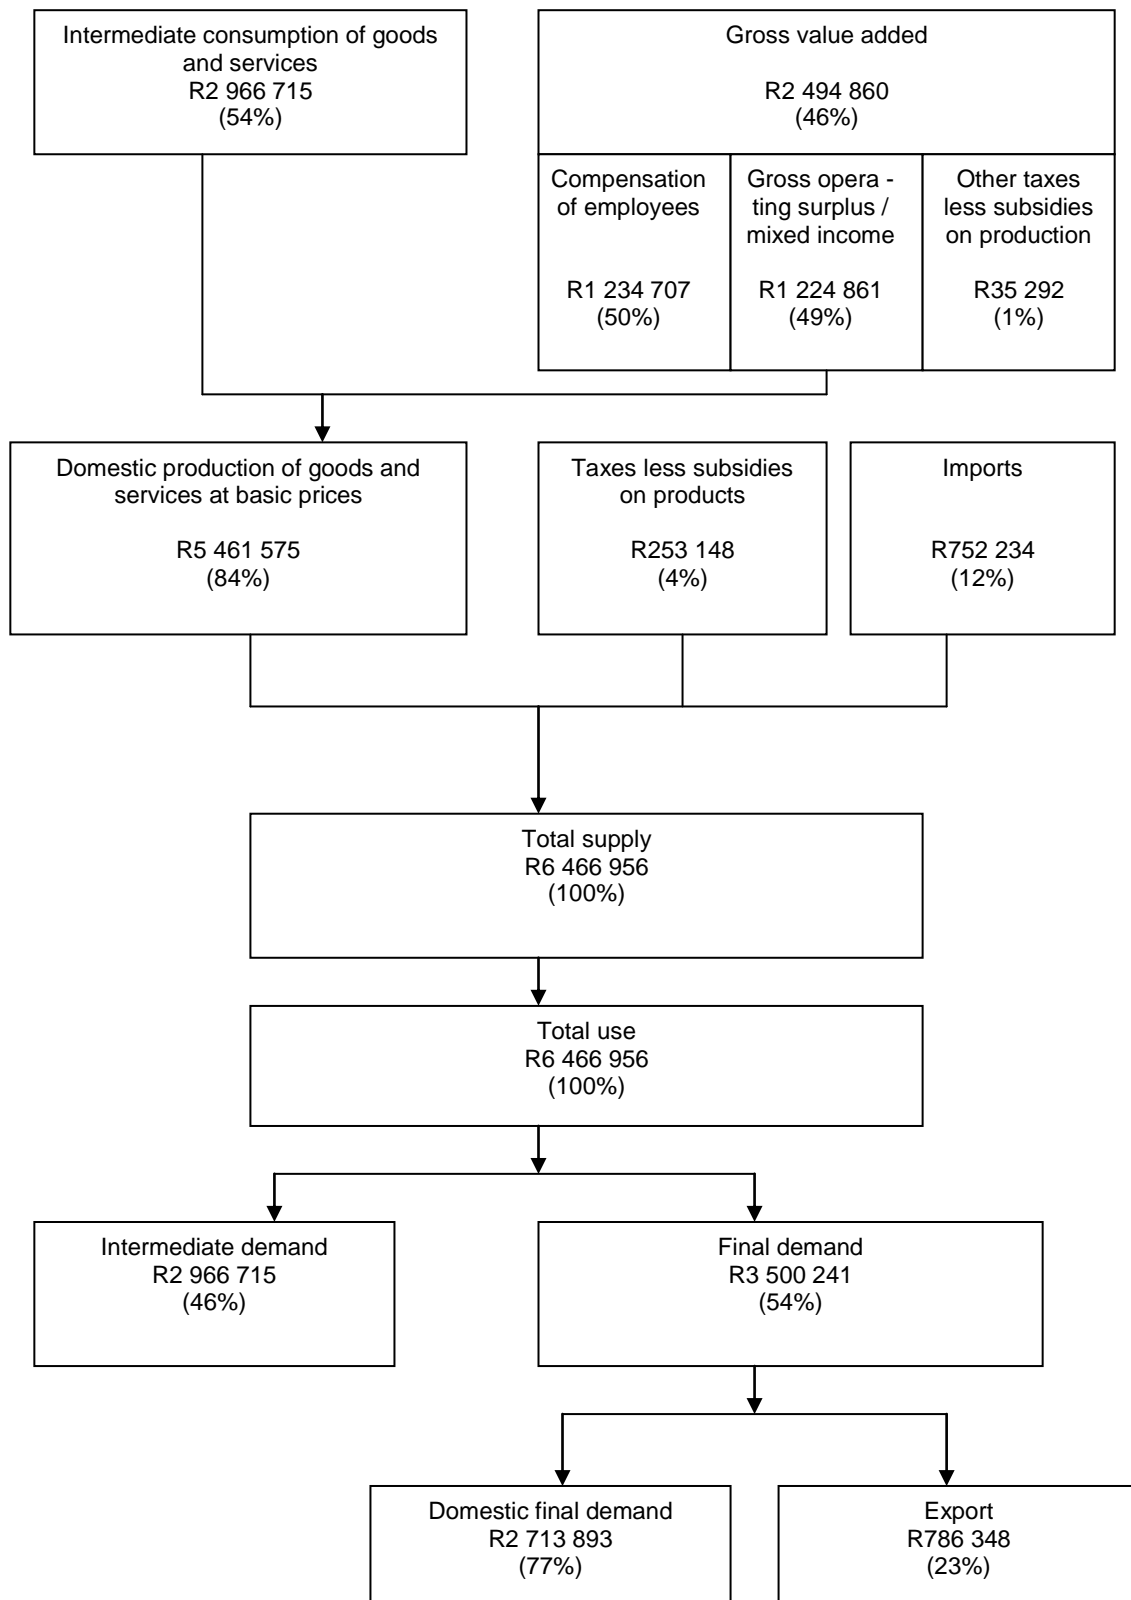

In other types of analysis, alternative concepts are emphasised, such as the enlargement of the production boundary through the inclusion of domestic services by members of the household. In these approaches, the economic process itself is depicted differently, and complementary or alternative aggregates are calculated.

The analysis of a number of important fields such as the environment may benefit by building a framework to accommodate elements included in the central accounts, explicitly or implicitly, plus complementary elements, either monetary or in physical quantities, and possibly alternative concepts and presentations.

Alternative view

As an alternative, the flows of goods and services in the economy, as well as macroeconomic concepts associated with the flows, can be explained through using a diagram (Figure 2). This diagram is based on the principle that total supply = total use (demand) in the economy. It further shows that total supply (R6 466 959 million) can be derived by adding domestic production at basic prices (R5 461 575 million), taxes less subsidies on products (R253 148 million) and imports (R752 233 million). Furthermore, domestic production at basic prices (R5 461 575 million) is a combination of intermediate consumption of goods and services by all industries (R2 966 715 million) and gross value added, i.e. compensation of employees, gross operating surplus/mixed income and other taxes less subsidies on production (R2 494 860 million). The total use (R6 466 959 million) consists of final demand (R3 500 241 million) and intermediate demand (R2 966 715 million). The distribution of intermediate consumption and domestic final demand between goods and services is also shown.

Figure 2 – Flow of goods and services according to the 2010 supply and use tables (R million)

Balancing process

The SU-tables were balanced through the application of the "commodity flow method", where applicable. This is a method whereby the detailed supply of goods and services (whether imported or domestically produced) is allocated between various intermediate or final uses, including exports. It is reliant on detailed basic statistics and is most powerful when independent estimates are made for both the supply and the use of each commodity.

The first step in the balancing process of the 2010 SU-tables was to concentrate on balancing of information relating to specific industries. Production and generation of income accounts were compiled for each industry, ensuring that the calculation of GDP was consistent from both the production and the income approach.

Secondly, the estimates/structures referring to components of final demand in the SU-tables were adjusted to comply with the level estimates published by the SARB. This allowed for the construction of a goods and services account, from which the difference (residual item) in the calculation of the GDP using the expenditure approach and the production/income approach could be estimated.

The third phase of the balancing process was to disaggregate the output and intermediate consumption items of the industrial production accounts across the detailed product categories. A similar process was followed for the components of final demand in the goods and services account, as well as the estimates of taxes and subsidies on products.

The fourth step was the calculation of trade and transport margins. This was required to adjust the valuation of the supply of products from basic to purchasers' prices. After this, the residual item, as calculated in the second step, was allocated according to product classification in the use table.

During the fifth step, the initial residual (both positive and negative), between the supply and use of products at purchasers' prices, was addressed through data confrontation and the use of the commodity flow approach. This entailed the verification of the quality of the data and the classification thereof, on both sides of the equation, for each product. After investigation of the data, judgmental decisions were required in order to adjust the total supply or use of products at purchasers' prices.

In cases where sound decisions could not be made as to the accuracy of contradicting statistics and where historic trends and patterns proved insufficient, the results were left unchanged and are reflected in the residual of the detailed tables.

The tables

2010 SU-tables

Two tables are published in respect of 2010, namely:

- a detailed supply table (Table 1); and
- a detailed use table (Table 2).

The tables provide an aggregated view of the supply and use tables (SU-tables) to calculate gross domestic product (GDP) by means of the income, production and expenditure approaches.

Furthermore, the detailed tables reflect a residual, implying that GDP calculated according to the income and production approaches differs from GDP calculated from the expenditure side. Publishing the residual in respect of products is specifically aimed at revealing the shortcomings in various data sources in order to investigate and rectify them.

Future SU-tables

The compilation of SU-tables places a heavy burden on source data. It is, however, the aim of Statistics South Africa (Stats SA) not only to reduce the time lag between the publication of SU-tables and the reference year, but also to improve the quality and consistency of the various data sources.

Stats SA compiles and publishes annual SU-tables. Apart from serving statistical purposes and aiding the estimation of annual GDP estimates, these publications serve as a basis for periodic SAMs.

The supply of products

The simple question "Who produces what?" is easily answered by referring to the supply table, where each row shows the distribution of output of each product (indicated by "P") by industry and where each column lists the distribution of output of each industry (indicated by "I") by product.

One finds, for example, that in 2010 the grain mill industry (column I19 of the supply table) produced R14 419 million of grain mill products (row P16) while all domestic industries combined produced R21 767 million of grain mill products. Thus, the grain mill industry accounted for 66,2% of the total domestic production of grain mill products in 2010.

The use of products

The use table displays the demand for various goods and services, which may be used as intermediate inputs (products that are purchased by an industry from other industries to produce its outputs) or for final consumption by households, government, etc.

The question "Who buys what?" is answered in the use table. Elements in the row of the use table show the use of a particular product by various industries as well as the use of this product by various categories of final demand.

In 2010, for example, all industries used grain mill products (column T1 of the use table, row P16) worth R8 449 million – the sum of row P16 across the columns I1–I171 of the use table.

This tabular presentation provides an analytical basis for understanding supply of and demand for the products of any given industry. As Stats SA produces final SU-tables on an annual basis, users will be able to monitor changes over time.

Value added by industry

Generally speaking, the gross output of an industry consists of the value of the goods and services produced by that industry: the value of grain mill products produced by the grain mill industry; the value of cars and trucks produced by the motor vehicle manufacturing industry, etc. A brief reflection shows that, for example, the production of grain mill products requires agricultural products and other inputs. These goods and services are not the products of grain mills. Rather, they are produced by other industries and used by grain mills as their inputs. Thus, a measure of the unduplicated production of an industry should exclude all intermediate inputs purchased from other industries.

The use table displays all the costs incurred in production by an industry; the goods and services used as intermediate inputs; returns to the factors of production (rows V2 and V7), namely compensation of employees and operating surplus/mixed income as well as taxes less subsidies (row V3). The latter entries, when combined, constitute "Value added at basic prices", representing the contribution of the industry concerned to the total value of production of the economy.

Gross domestic product (GDP) for the total economy

In order to derive the measure of "Gross domestic product at market prices" for the total economy, net taxes on products, i.e. taxes on products less subsidies on products, should also be added to the measure of value added at basic prices, as they are a part of the market price of goods and services. The net taxes in this case indicate that total subsidies on products (row V5) have been subtracted from total taxes on products (row V4). It should be noted that taxes are paid not only by the business sector but also by other sectors of the economy, which are covered in the final demand component of the use table in this publication.

GDP at market prices as calculated above is called income-based GDP. In addition, the supply and use tables also incorporate components of expenditure-based GDP, i.e. household consumption expenditure (column F3 of the use table), government consumption expenditure (column F4 of the use table), fixed capital formation (column F5 of the use table), changes in inventories (column F6 of the use table) and net exports [exports (column F2 of the use table) less imports (column F1 of the supply table)].

Additional information

Explanatory notes

- | | | |
|---|----------|---|
| Introduction | 1 | This report contains the 2010 Supply and Use tables (SU-tables), estimated according to the recommendations of the 2008 System of National Accounts (2008 SNA). The 2008 SNA is an updated version of the 1993 SNA, bringing the national accounting framework into line with the needs of data users. |
| Scope of the supply and use tables | 2 | The SU-tables cover the entire economy: 174 different industry groups, 104 product groups as well as six different components of final demand are distinguished. |
| Classification | 3 | <p>The 1993 edition of the Standard Industrial Classification of all Economic Activities (SIC), Fifth Edition, Report No. 09-90-02 was used to classify the industries or economic activities in the System of National Accounts. The SIC is based on the 1990 (third revision) International Standard Industrial Classification of all Economic Activities (ISIC), with suitable adaptations for local conditions. The third revision of the ISIC differs in various respects from the previous edition. Therefore, the fifth edition of the SIC also differs from previous editions. Table M provides information on the industry groups that are included in the SU-tables.</p> <p>A commodity classification was developed for use in the SU-tables which is closely related to the SIC classification. The aim was to simplify the process of creating square SU-tables. More information on the product groups is provided in Table J and Table K.</p> |
| Reference period and time of recording | 4 | The tables record production activities and transactions of goods and services conducted in South Africa during the reference year, i.e. 2010. Domestic production of goods is recorded at the time they are produced and that of services at the time they are provided. Intermediate consumption of goods and services is recorded at the time they are actually used in the production process. Final consumption of goods and services by households and general government is recorded at the time they are purchased irrespective of their delivery in general. Goods for fixed capital formation are recorded at the time they are delivered, and changes in inventories are recorded at the time legal proprietary rights are transferred. Imports and exports are recorded at the time of customs clearance. |

P104	Other services n.e.c.	951, 952, 959, 961, 962, 963, 964, 965, 966, 969, 971, 972, 973, 979, 980, 990
D1	Purchases by residents	Direct purchases abroad by residents
D2	Purchase by non-residents - domestic	Direct purchases in the domestic market by non-residents
V1	Total gross value added / GDP	Sum of value added for industries or gross domestic product for the economy
V2	Compensation of employees	Compensation of employees
V3	Taxes less subsidies	Taxes less subsidies on production and imports

Table K – Description of products used in the use table (concluded)

Row no.	Use table description	Central Product Classification (CPC)
V4	Taxes on products	Taxes on products
V5	Subsidies on products	Subsidies on products
V6	Other taxes on production	Other taxes on production
V7	Other subsidies	Other subsidies
V8	Gross operating surplus / mixed income	Gross operating surplus of industries / gross mixed income of households and non-profit institutions

Annexure 3 – Key between industry descriptions and SIC-groups

The abbreviated description of industries used in the SU-tables and corresponding SIC-group codes are shown in Table K.

Table K – Description of industries used in the SU-tables

Col. no.	SU-tables description	SIC classification included
I1	Agriculture, hunting and related services	1111, 1112, 1113, 1121, 1122, 1130, 1140, 1151, 1152, 1160
I2	Forestry, logging and related services	1210, 1220
I3	Fishing, operation of fishing hatcheries and fish farms	1310, 1320
I4	Mining of coal and lignite	2100
I5	Mining of gold and uranium	2300
I6	Iron ores	2410
I7	Chrome mining	2421
I8	Copper mining	2422
I9	Manganese mining	2423
I10	Platinum mining	2424
I11	Other metal ore mining	2429
I12	Other mining and quarrying	2511, 2512, 2519, 2531,2532, 2539, 2212
I13	Services activities, mining	2900
I14	Meat	3011
I15	Fish	3012
I16	Fruit and vegetables	3013
I17	Oils and fats	3014
I18	Dairy products	3020
I19	Grain mill	3031
I20	Starches and starch products	3032
I21	Animal feeds	3033
I22	Bakery	3041
I23	Sugar	3042
I24	Cocoa, chocolate	3043
I25	Pastas	3044
I26	Other food	3049
I27	Beverages, tobacco	3051, 3052, 3053,3054, 3060
I28	Spinning, weaving of textiles	3111
I29	Finishing of textiles	3112
I30	Made-up textiles	3121
I31	Carpets, rugs and mats	3122
I32	Cordage, rope, twine, netting	3123
I33	Other textiles	3129

Table K – Description of industries used in the SU-tables (continued)

Col. no.	SU-tables description	SIC classification included
I34	Knitting, crocheted fabrics	3130
I35	Wearing apparel	3140
I36	Articles of fur	3150
I37	Tanning, dressing of leather	3161
I38	Luggage, handbags, saddler	3162
I39	Footwear	3170
I40	Sawmilling, planing of wood	3210
I41	Veneer sheets, plywood, laminboard	3221
I42	Builders' carpentry and joinery	3222
I43	Wooden containers	3223
I44	Other products of wood	3229
I45	Pulp, paper and paperboard	3231
I46	Corrugated paper, containers of paper	3232
I47	Other articles of paper	3239
I48	Books, brochures, other publications	3241
I49	Newspapers, journals and periodicals	3242
I50	Other publishing	3243, 3249
I51	Printing	3251
I52	Services relating to printing	3252
I53	Reproduction of recorded media	3260
I54	Petroleum products	3310, 3321, 3323, 3322, 3324, 3325, 3329, 3330
I55	Basic chemicals	3341
I56	Fertilisers	3342
I57	Plastics in primary form	3343
I58	Pesticides, agro-chemicals	3351
I59	Paints, varnishes, printing ink, mastics	3352
I60	Pharmaceuticals, medical chemicals	3353
I61	Soap, detergents, medical chemicals	3354
I62	Other chemicals n.e.c.	3359, 3360
I63	Rubber tyres, tubes, retreading	3371
I64	Other rubber tyres	3379
I65	Plastic	3380
I66	Glass and glass products	3411
I67	Non-structural non-refractory ceramicware	3421
I68	Refractory ceramic products	3422
I69	Structural non-refractory products	3423
I70	Cement, lime, plaster	3424

Table K – Description of industries used in the SU-tables (continued)

Col. no.	SU-tables description	SIC classification included
I71	Articles of concrete, cement plaster	3425
I72	Cutting, shaping, finishing of stones	3426
I73	Other non-metallic minerals n.e.c.	3429
I74	Basic iron and steel	3510
I75	Basic precious and non-ferrous metal	3520
I76	Casting of metals	3531, 3532
I77	Structural metal products	3541
I78	Tanks, reservoirs, containers of metal	3542
I79	Steam generators	3543
I80	Forging, pressing, stamping of metal	3551
I81	Treatment and coating of metal	3552
I82	Cutlery, hand tools general hardware	3553
I83	Other fabricated metal products n.e.c.	3559
I84	Engines and turbines	3561
I85	Pumps, compressors, taps and valves	3562
I86	Bearings, gears, driving elements	3563
I87	Lifting and handling equipment	3565
I88	Other special purpose machinery	3564, 3569
I89	Agriculture, forestry machinery	3571
I90	Machine tools	3572
I91	Machinery for metallurgy	3573
I92	Machinery for mining, quarrying, construction	3574
I93	Machinery for food, beverages, tobacco	3575
I94	Machinery for textiles, apparel, leather	3576
I95	Other special purpose machinery	3577, 3579
I96	Household appliances n.e.c.	3580
I97	Office, accounting, computing machinery	3590
I98	Electric motors, generators, transformers	3610
I99	Electricity distribution, control apparatus	3620
I100	Insulated wire and cable	3630
I101	Accumulators, primary cells and batteries	3640
I102	Electric lamps, lighting equipment	3650
I103	Other electrical equipment n.e.c.	3660
I104	Electronic valves, tubes, components	3710
I105	Television, radio transmitters, apparatus	3720
I106	Television, radio receivers, recording	3730
I107	Medical and surgical equipment	3741

Table K – Description of industries used in the SU-tables (continued)

Col. no.	SU-tables description	SIC classification included
I108	Instruments for measuring, checking, testing	3742
I109	Industrial process control equipment	3743
I110	Optical instruments, photographic equipment	3750
I111	Watches and clocks	3760
I112	Motor vehicles	3810
I113	Bodies of motor vehicles, trailers	3820
I114	Parts, accessories for motor vehicles	3830
I115	Building, repairing of boats and ships	3841, 3842
I116	Railway, tramway locomotives, rolling stock	3850
I117	Aircraft	3860
I118	Other transport	3871, 3872, 3879
I119	Furniture	3910
I120	Jewellery and related articles	3921
I121	Other manufacturing n.e.c.	3922, 3923, 3924, 3929, small-scale manufacturing
I122	Recycling of metal, non-metal waste and scrap n.e.c.	3951, 3952
I123	Electricity and gas	4111, 4120, 4130
I124	Water	4200
I125	Site preparations	5010
I126	Building of complete construction	5021, 5022, 5023, 5024
I127	Building installation	5031, 5032, 5039
I128	Building completion	5041, 5042, 5049
I129	Renting of construction equipment	5050
I130	Wholesale trade on fee	6110
I131	Wholesale of agriculture raw material	6121, 6122
I132	Wholesale of household goods	6131, 6139
I133	Wholesale of non-agriculture products, waste, scrap	6141, 6142, 6143, 6149
I134	Wholesale trade in machinery, equipment, supplies	6150
I135	Other wholesale trade	6190
I136	Other retail trade in stores	6211, 6219
I137	Retail trade in food, beverages, tobacco	6220
I138	Other retail	6231, 6232, 6233, 6234, 6239, 6240, 6251, 6252, 6259
I139	Repair of personal and household goods	6260
I140	Sale of motor vehicles	6311, 6312

Table K – Description of industries used in the SU-tables (concluded)

Col. no.	SU-tables description	SIC classification included
I141	Maintenance and repair of motor vehicles	6320
I142	Sale of motor vehicle parts and accessories	6331, 6332
I143	Sale, maintenance, repair, fuel	6340, 6350
I144	Accommodation	6410
I145	Restaurants	6420
I146	Land transport	7111, 7121, 7122, 7123, 7130
I147	Water transport	7211, 7220
I148	Air transport	7300
I149	Supporting and auxiliary transport	7411, 7412, 7413, 7414, 7419
I150	Post and telecommunication	7511, 7512, 7520
I151	Financial intermediation	8111, 8112, 8191, 8192, 8199
I152	Insurance, pension funding	8211, 8212, 8213, 8219
I153	Activities auxiliary to financial intermediation	8311, 8312, 8319, 8320
I154	Real estate activities	8411, 8412, 8413, 8421, 8422
I155	Renting of machinery and equipment	8511, 8512, 8513, 8521, 8522, 8523, 8529, 8530
I156	Computer and related activities	8610, 8620, 8630, 8640, 8650, 8690
I157	Research and development	8711, 8712, 8713, 8714, 8719, 8720
I158	Legal, accounting, bookkeeping, audited activities	8811, 8812, 8813, 8814
I159	Architectural, engineering, other related consultant fees	8821, 8822
I160	Advertising	8831
I161	Business activities n.e.c.	8891, 8892, 8893, 8894, 8895, 8896, 8899
I162	Central government	911 Central
I163	Provincial government	911 Provincial
I164	Local government	912 Local
I165	Education and other training services	9201, 9202, 9203
I166	Health activities	9311, 9312, 9319, 9320, 9330
I167	Sewerage, refuse, sanitation	9400
I168	Membership activities	9511, 9512, 9520, 9591, 9592, 9599
I169	Recreation, cultural, sport activities	9611, 9612, 9613, 9614, 9619, 9620, 9631, 9632, 9641, 9649
I170	Other services	9901, 9902, 9903, 9909, 9999
I171	Non-observed, informal, non-profit, households	Sic 1, Sic 2, Sic 3, Sic 5, Sic 6, Sic 7, Sic 9, 0100, 0200, 0300, 0400, 0500, 0600, 0700, 0800, 0900

Annexure 4 – Description of adjustment items, components of value added and final demand

The description of the adjustment items, components of value added and final demand used in the SU-tables are detailed in Table L.

Table L – Description of adjustment items, components of value added and final demand

Item no.	SU-tables description	Detailed description
C1	c.i.f./f.o.b. adjustment	Adjustment of detailed imports (valued c.i.f.) to total imports (valued f.o.b.)
D1	Purchases by residents	Direct purchases abroad by residents
D2	Purchases by non-residents	Direct purchases in the domestic market by non-residents
F1	Imports	Import of goods and services
F2	Exports	Export of goods and services
F3	Household consumption expenditure	Final consumption expenditure incurred by households
F4	General government consumption expenditure	Final consumption expenditure incurred by general government
F5	Fixed capital formation	Gross fixed capital formation
F6	Changes in inventories	Changes in inventories
F7	Residual	Residual item derived from the goods and services account
V1	Total gross value added / GDP	Sum of value added for industries or gross domestic product for the economy
V2	Compensation of employees	Compensation of employees
V3	Taxes less subsidies	Taxes less subsidies on production and imports
V4	Taxes on products	Taxes on products
V5	Subsidies on products	Subsidies on products
V6	Other taxes less subsidies on production	Other taxes on production less subsidies on production
V7	Gross operating surplus / mixed income	Gross operating surplus of industries / gross mixed income of households

Annexure 5 – Statistical sources and methods

Table M summarises the most important statistical sources and methods used to compile the 2010 supply and use tables for each industry. Different statistical sources were used to calculate the required levels, e.g. total output, value added and intermediate consumption. The estimation of detailed output and consumption according to commodity is briefly referred to as well.

In addition to the detailed industry-specific sources that are listed in Table K, extensive use is made of the annual financial statistics (AFS). The AFS is a comprehensive survey covering the entire economy, excluding agriculture, financial intermediaries and the general government sector. It includes financial information relating to the income and expenditure statements of enterprises as well as their balance sheets.

Table M – Statistical sources and methods

Industry	Statistical sources and methods
Agriculture, forestry and fishing	<p>2007 Census of Agriculture conducted by Stats SA on behalf of the National Department of Agriculture, Forestry and Fishing (DAFF) was used.</p> <p>Input-output tables for Agriculture produced by the Department of Agriculture. These tables were used to determine the structure for agriculture, forestry and fishing.</p>
Mining	<p>Mining information was obtained from the 2012 Large sample survey that was published by Stats SA. This information was supplemented by gold mining industry information from the Chamber of Mines and information from the Department of Mineral Resources (DMR).</p> <p>Detailed information on stores consumed was used to estimate the cost structure of the mines in addition to detailed expenditure items collected through the 2012 survey of Mining. The information from the Department of Mineral Resources (DMR) on the sales of minerals was used to verify the output of the mines as obtained from the survey.</p>
Manufacturing	<p>The 2011 Manufacturing survey was used to tabulate all structural information in the SU-tables. The value added estimates were evaluated against the 2011 Manufacturing survey results and adjusted.</p>
Electricity and water	<p>Electricity, gas and water information was obtained from the 2010 Large sample survey published by Stats SA. Annual statistics are supplemented with financial statements obtained from ESKOM, the water boards and local authorities, as well as unpublished information from ESKOM.</p> <p>Historic input structures were updated from new data sources where possible.</p>
Construction	<p>Results from Stats SA's 2011 Large sample surveys. Benchmarking year estimates are extrapolated according to the trends in gross domestic fixed investment of residential and non-residential buildings and construction works as compiled by the SARB.</p>
Wholesale, retail and motor trade	<p>Wholesale trade and retail trade information was obtained from Large sample surveys conducted by Stats SA in 2009; motor trade data were obtained from the Large sample survey conducted by Stats SA for the reference period 2009.</p>

Table M – Statistical sources and methods (continued)

Industry	Statistical sources and methods
Hotels and restaurants	Accommodation information was obtained from the Large sample survey conducted for the reference period 2009 by Stats SA.
Transport and communication	<p>Transport and communication data were obtained from the 2010 Large sample survey conducted by Stats SA.</p> <p>Independent research regarding the taxi industry was also included.</p> <p>Furthermore, financial statements of major role players such as Transnet, Telkom and the South African Post Office were also obtained and analysed.</p> <p>Information on the output of the industry, as well as its cost structures, was used to estimate the relevant components in the SU-tables framework.</p>
Financial intermediation and insurance	<p>Annual and quarterly surveys conducted by the SARB among the various institutions in the private sector and information reported by public authorities and public corporations. The 2010 Large sample survey conducted by Stats SA for business services was also included.</p> <p>FISIM is calculated as a separate cost item for each industry in line with the recommendations of the 2008 SNA.</p>
Real estate (including imputed rent on residential buildings) and business services	<p>The 2010 Large sample survey conducted by Stats SA for business services was also included.</p> <p>Historic input structures were updated from new data sources where possible.</p>
Other private services	<p>The 2011 Population Census information, in conjunction with annual household surveys information, was used to calculate the data. This information is calculated by Stats SA and the SARB.</p> <p>Historic input structures were updated from new data sources where possible.</p>
General government services	<p>Government Financial Statistics (GFS) and Basic Accounting System (BAS) data of Stats SA, information from the SARB, and annual reports from local government authorities.</p> <p>The intermediate consumption expenditure of the general government was derived through the classification of detailed expenditure by different government departments, provincial governments and local government authorities.</p>
Private consumption expenditure	<p>The 2011 Population Census and General Household Survey conducted by Stats SA; information from the Bureau of Market Research and the SARB.</p> <p>Expenditure patterns of households are based on different data sources as well as historical trends.</p>
Government consumption expenditure	<p>Government Financial Statistics (GFS) and Basic Accounting System (BAS) data published by Stats SA; information from the SARB.</p> <p>The final consumption expenditure of general government is divided according to expenditure on collective services and individual goods and services.</p>

Table M – Statistical sources and methods (concluded)

Industry	Statistical sources and methods
Gross fixed capital formation	<p>Information contained in various economic surveys estimates of fixed capital formation published by the SARB; construction activities of the general government published by Stats SA; information on imported and exported capital goods.</p> <p>Gross fixed capital formation by type of product is estimated through the commodity flow approach. These results are evaluated against estimates obtained from various other models.</p>
Changes in inventories	<p>Information contained in various economic surveys, estimates of changes in inventories published by the SARB.</p> <p>The changes in inventories for raw materials, work-in-progress and finished goods were estimated separately according to type of product for each industry. The valuation adjustments were not done with a price index for each product, but rather through a proportional adjustment across all industries of the total valuation adjustment received from the SARB.</p>
Imports	<p>Detailed trade statistics from SARS (Customs and Excise) and information from the SARB.</p> <p>Detailed information on imports was reclassified from the Harmonised Commodity Classification System to the level of detail required in the SU-tables. The adjustment of c.i.f. and f.o.b. was based on information from both sources.</p>
Exports	<p>Detailed trade statistics from SARS (Customs and Excise) and information from the SARB.</p> <p>Detailed information on exports was reclassified from the Harmonised Commodity Classification System to the level of detail required in the SU-tables.</p>
Taxes and subsidies on production and imports	<p>Information contained in various economic surveys. Auditor-General reports; the South African National Budget; the Economic and Functional Classification of the Expenditure of General Government; and the Department of Trade and Industry.</p>
Trade and transport margins	<p>Periodic surveys of Wholesale Trade, Commercial Agents; Retail Trade; Motor Trade and Repair Services; and Transport and Allied Services published by Stats SA, as well as information obtained from Transnet.</p>
Direct purchases abroad (in domestic market) by (non-) residents	<p>Unpublished information from SARB.</p>

Glossary

Ancillary activity	An ancillary activity is a supporting activity undertaken to create the conditions within which the activities of an enterprise can be carried out.
Balancing item	A balancing item is an accounting construct obtained by subtracting the total value of the entries on one side of an account from the total value of the entries on the other side. Balancing items are not simply devices introduced by the SNA to ensure that accounts balance. They encapsulate a great deal of information and include some of the most important entries in the accounts, for example value added and operating surplus.
Basic price	The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output <i>minus</i> any tax payable <i>plus</i> any subsidy receivable on that unit as a consequence of its production or sale. Basic prices exclude any transport charges invoiced separately by the producer. Basic price is the preferred method of valuing output.
Benchmark years	Benchmark years refer to those years in respect of which authoritative and detailed data are available.
Commodity flow method	The commodity flow method is used to track the flow of goods and services from the supply (domestic production or imported) to the use (intermediate consumption, final consumption or exports) thereof.
Compensation of employees	Compensation of employees is defined as the total remuneration, in cash or kind, payable by an employer to an employee in return for work done by the latter during the accounting period. It is recorded on a gross basis, i.e. before any deduction for income taxes, pensions, unemployment insurance and other social insurance schemes. It also includes other forms of compensation, namely commissions, tips, bonuses, directors' fees and allowances such as those for holidays and sick leave, as well as military pay and allowances. It excludes employers' social contributions.
Cost, insurance and freight price	The cost, insurance and freight price (c.i.f.) is the price of a good delivered at the frontier of the importing country, or the price of a service delivered to resident, before payment of any import duties or other taxes on imports or trade and transport margins within the country.
Enterprise	An enterprise may be a corporation (a quasi-corporate enterprise is treated as if it is a corporation in the SNA), a non-profit institution or an unincorporated enterprise. Corporate enterprises and non-profit institutions are complete institutional units. An unincorporated enterprise, however, refers to an institutional unit – a household or government unit – only in its capacity as a producer of goods and services. It covers only those activities of the unit which are directed towards the production of goods and services.
Establishment	An establishment is defined as an enterprise or part of an enterprise that is situated at a single location and in which only a single (non-ancillary) productive activity is carried out or in which the principal productive activity accounts for most of the value added.
Factor cost	Factor cost is a valuation concept reflecting the cost of the factors of production (labour and capital). It corresponds to the value remaining after all applicable taxes and subsidies have been deducted from market prices.
Final demand	Different components of final demand are distinguished in the SU-tables. The supply table shows imports and the use table shows final consumption expenditure by households and the general government as well as gross capital formation (gross fixed capital formation and changes in inventories) and exports.

Financial intermediaries services indirectly measured	Financial intermediaries services indirectly measured (FISIM) are measured in the SNA as the total property income receivable by financial intermediaries minus their total interest payable, excluding the value of any property income receivable from the investment of their own funds. Therefore, income does not arise from financial intermediation.
Free on board price	The free on board price (f.o.b.) is the purchaser's price paid by an importer taking delivery of goods at the exporter's frontier after loading on to a carrier and after payment of any export taxes or the receipt of any tax rebates.
GDP at market prices	GDP at market prices equals total gross value added at basic prices <i>plus</i> taxes on products <i>minus</i> subsidies on products.
GDP for the economy	GDP for the entire economy is equal to GDP at market prices. It is essentially a production measure as it is obtained through the sum of the gross values added of all resident institutional units, in their capacity as producers, <i>plus</i> the values of any taxes, <i>less</i> subsidies, on production or imports not already included in the values of the outputs and values added by resident producers.
Generation of income account	The generation of income account provides for the distribution of primary incomes to the various institutional sectors. Primary incomes are incomes that accrue to institutional sectors and industries as a consequence of their involvement in processes of production or ownership of assets that may be needed for purposes of production.
Goods and services account	The goods and services account shows the total resources (output and imports) and uses of goods and services (intermediate consumption, final consumption, gross capital formation and exports). Taxes on products (less subsidies) are also included on the resource side of the accounts.
Gross operating surplus/mixed income	Gross operating surplus or mixed income is the balancing item in the generation of income account, i.e. the value added <i>minus</i> compensation of employees payable <i>minus</i> taxes on production payable <i>plus</i> subsidies receivable.
Gross value added at basic prices	Gross value added at basic prices is defined as output valued at basic prices less intermediate consumption valued at purchasers' prices.
Gross value added at producers' prices	Gross value added at producers' prices is defined as output valued at producers' prices less intermediate consumption valued at purchasers' prices.
Homogeneous production	A unit of homogeneous production is defined as a producer unit in which only a single (non-ancillary) productive activity is carried out.
Industries	Industries consist of groups of establishments engaged in the same or similar kinds of activity. The definition of industries is based on the 1993 SNA and is in line with that contained in the Standard Industrial Classification of all Economic Activities, Fifth Edition, Report No. 09-90-02 of January 1993 (SIC).
Institutional unit	An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities.
Intermediate consumption	Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets. Consumption of fixed assets is recorded as consumption of fixed capital.
Non-observed economy	The non-observed economy is the extent of the economic activity missing from statistical data collections and from administrative source.

Other taxes on production	Other taxes on production consists of taxes on the ownership of land, buildings or other assets used in production or on labour employed, etc. Important examples of other taxes on production are taxes on payroll or work force, business or professional licences.
Output	Output consists of those goods or services that are produced within an establishment that become available for use outside the establishment, plus any goods and services produced for own final use.
Operating surplus or mixed income	Operating surplus or mixed income is the balancing item in the generation of income account, i.e. the value added minus compensation of employees payable minus taxes on production payable plus subsidies receivable.
Primary sector	The primary sector includes the agriculture, forestry and fishing, mining and quarrying industries.
Principal activity	The principal activity of an establishment is the activity whose gross value added exceeds that of any other activity carried out within the same unit.
Producer's price	The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser. It excludes any transport charges invoiced separately by the producer.
Production account for the total economy	The production account is the first in the sequence of accounts compiled for institutional sectors, industries and the total economy. The production account contains three items apart from the balancing item, namely output, intermediate consumption and taxes less subsidies on products. The output is recorded under resources on the right-hand side of the account. Intermediate consumption and taxes less subsidies on products is recorded under uses on the left-hand side of the account.
Production boundary	The general production boundary is defined as an economic activity (or production) carried out under the control and responsibility of an institutional unit that uses inputs of labour, capital, and goods and services to produce output of goods and services. The production boundary in the SNA is more restricted than the general production boundary due to the production accounts not being compiled for household activities that produce domestic or personal services for own final consumption within the same household, except for services produced by paid domestic staff.
Purchaser's price	The purchaser's price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.
Secondary activity	A secondary activity is an activity carried out within a single establishment in addition to the principal activity.
Secondary sector	The secondary sector includes the manufacturing, electricity, gas, water and construction industries.
Sector	A sector is an area of the economy; economies are composed of four sectors, i.e. the primary sector, which involves the extraction and harvesting of natural products from the earth; the secondary sector, which consists of processing, manufacturing and construction; the tertiary sector, which provides services; and the quaternary sector, which is made up of intellectual pursuits.
Square	A matrix is square when it has an equal number of columns and rows.

Other subsidies on production	Subsidies are transfers from the government to the business sector towards current cost of production. These transfers represent additions to the income of producers from current production.
Subsidies on products	Subsidies on products are payable per unit of a good or service.
Supply and use tables	The SU-tables are sometimes referred to as rectangular input-output tables, make and use tables, supply and disposition of commodities tables.
Supply table	The supply table gives information about the resources of goods and services.
Symmetric	Symmetric tables use similar classifications or units, i.e. same groups of products for both the rows and the columns.
System of National Accounts	The System of National Accounts refers to an internationally agreed standard system for macroeconomic accounts. The latest version is described in the 2008 System of National Accounts (2008 SNA).
Taxes on income	Taxes on income consist of taxes on incomes, profits and capital gains. They are assessed on the actual or presumed incomes of individuals, households, non-profit institutions serving households (NPISH) or corporations. They include taxes assessed on holdings of property, land or real estate when these holdings are used as a basis for estimating the income of their owners.
Taxes on production and imports	Taxes on production and imports are taxes that add to the cost of production and are likely to be reflected in market prices paid by the purchaser, such as sales and excise taxes, import duties and property taxes. Taxes on production and imports include taxes on products and other taxes on production.
Taxes on products	Taxes on products consist of taxes payable on goods and services when they are produced, delivered, sold or otherwise disposed of by their producers. Furthermore, they are payable per unit of a good or service produced. Important examples of taxes on products are excise and import duties and VAT.
Tertiary sector	The tertiary sector includes wholesale and retail trade and motor trade; catering and accommodation; transport and communication; finance, real estate and business services; community, social and personal services; general government services; and other producers.
Use table	The use table gives information on the uses of goods and services, and also on cost structures of the industries.
Value added components	The use table distinguishes three different components of value added, i.e. compensation of employees; other taxes less subsidies on production; and gross operating surplus/mixed income.
Value added by industry	Value added measures the value created by production, and may be calculated either before or after deducting the consumption of fixed capital on the fixed assets used. Gross value added is defined as the value of output less the value of intermediate consumption. Value added is the balancing item in the production account for an institutional unit or sector, or establishment or industry.
